- Log messages would be truncated to 300 bytes. (Bug #28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug #28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.

### D.4.9.4. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

**Bugs fixed:**

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug #28448)
- Building a connection string within a tight loop would show slow performance. (Bug #28167)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug #27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySQLCommandBuilder` to obtain the parameter information. (Bug #27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug #27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug #27289)
- When cloning an open `MySQLClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug #27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug #26754)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug #26472)
- The `characterset` property would not be identified during a connection (also affected Visual Studio Plugin). (Bug #26147, Bug #27240)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug #25947)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. (Bug #23342)

#### D.4.9.5. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

**Bugs fixed:**

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #27253)
- `DESCRIBE ....` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug #27221)
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug #27187)
- `MySQLParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #27135)
- Exception thrown when using large values in `UInt64` parameters. (Bug #27093)
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/NET 5.0.5. (Bug #26960)

#### D.4.9.6. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

**Functionality added or changed:**

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.

- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to enable calling procedures without using procedure metadata.

**Bugs fixed:**

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug #26660)
- MySQL Connector/NET would fail to install under Windows Vista. (Bug #26430)
- Opening a connection would be slow due to host name lookup. (Bug #26152)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug #25950)
- Registry would be incorrectly populated with installation locations. (Bug #25928)
- Times with negative values would be returned incorrectly. (Bug #25912)
- Returned data types of a `DataTypes` collection do not contain the right correct CLR data type. (Bug #25907)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug #25906)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug #25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug #25609)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug #25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #25603)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug #25569)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug #25458)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #24957)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug #24802)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug #24373)
- MySQL Connector/NET would not compile properly when used with Mono 1.2. (Bug #24263)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

#### D.4.9.7. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

This section has no changelog entries.

#### D.4.9.8. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

##### Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns.GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The ShapZipLib library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

##### Bugs fixed:

- Additional text added to error message (Bug #25178)
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. (Bug #25033)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #25013)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #24661)
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. (Bug #24565)
- Stored procedure executions are not thread safe. (Bug #23905)
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. (Bug #23687)
- Nested transactions (which are unsupported) do not raise an error or warning. (Bug #22400)

#### D.4.9.9. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

##### Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.

- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

**Bugs fixed:**

- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. (Bug #23758)
- Column names with accented characters were not parsed properly causing malformed column names in result sets. (Bug #23657)
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. (Bug #23538)
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. (Bug #23268)
- During installation, an antivirus error message would be raised (indicating a malicious script problem). (Bug #23245)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/NET 5.0.2 must be installed. (Bug #23071)
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied`. (Bug #22882)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug #18186)
- MySQL Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. (Bug #16126)

#### D.4.9.10. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

**Bugs fixed:**

- MySQL Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #22452)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug #22042)
- The `MySqlException` class is now derived from the `DbException` class. (Bug #21874)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug #21521)
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #19994)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. (Bug #18391)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug #11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug #9619)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #7248)

- Incorrect field/data lengths could be returned for [VARCHAR](#) UTF8 columns. Bug (#14592)

#### D.4.9.11. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

##### Functionality added or changed:

- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented PacketReader/PacketWriter support into [MySqlStream](#) class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented [MySqlClientFactory](#) class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented [MySqlConnectionBuilder](#) class.

##### Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. (Bug #6214)

#### D.4.10. Changes in MySQL Connector/NET Version 1.0.x

##### D.4.10.1. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

##### Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. (Bug #33682)
- Setting the size of a string parameter after the value could cause an exception. (Bug #32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. (Bug #32093)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Commands executed from within the state change handler would fail with a [NULL](#) exception. (Bug #30964)
- Extracting data through XML functions within a query returns the data as [System.Byte\[\]](#). This was due to MySQL Connector/NET incorrectly identifying [BLOB](#) fields as binary, rather than text. (Bug #30233)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed)

communication. (Bug #27865)

- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug #13991)

#### D.4.10.2. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

##### Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #27253)
- `MySQLParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #27135)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug #25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #25603)
- When a `MySQLConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySQLPool.GetConnection`. (Bug #24373)

#### D.4.10.3. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

##### Functionality added or changed:

- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

##### Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug #25912)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug #25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug #25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #25443)
- Additional text added to error message. (Bug #25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #25013)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug #24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #24661)
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. (Bug #24565)
- Stored procedure executions are not thread safe. (Bug #23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug #23862)
- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. (Bug #23758)
- Nested transactions do not raise an error or warning. (Bug #22400)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

#### D.4.10.4. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

##### Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

##### Bugs fixed:

- MySQL Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #22452)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug #21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug #20581)
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #19994)
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug #19515)
- When running a query that included a date comparison, a `DateReader` error would be raised. (Bug #19481)

- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug #19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug #19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. (Bug #18391)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug #17814)
- CHAR type added to `MySqlDbType`. (Bug #17749)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug #17736)
- The `CommandBuilder` ignored `Unsigned` flag at `Parameter` creation. (Bug #17375)
- When working with multiple threads, character set initialization would generate errors. (Bug #17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug #16934)
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `datetime` field with a null value. (Bug #16884)
- Unsigned data types were not properly supported. (Bug #16788)
- The connection string parser did not permit single or double quotation marks in the password. (Bug #16659)
- The `MySqlDateTime` class did not contain constructors. (Bug #15112)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug #15077)
- Using `ExecuteScalar` with a `datetime` field, where the value of the field is `"0000-00-00 00:00:00"`, a `MySqlConversionException` exception would be raised. (Bug #11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (`0000-00-00 00:00:00`). (Bug #9619)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug #8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

#### D.4.10.5. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

##### Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug #18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug #14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug #13927)
- Added support for the `cp932` character set. (Bug #13806)
- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug #13753)

- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug #13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug #13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug #13541)

#### D.4.10.6. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

##### Bugs fixed:

- MySQL Connector/NET 1.0.5 could not connect on Mono. (Bug #13345)
- Serializing a parameter failed if the first value passed in was `NULL`. (Bug #13276)
- Field names that contained the following characters caused errors: `( ) % < > /` (Bug #13036)
- The `nant` build sequence had problems. (Bug #12978)
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. (Bug #12835)

#### D.4.10.7. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

##### Bugs fixed:

- MySQL Connector/NET could not connect to MySQL 4.1.14. (Bug #12771)
- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last host in the list. (Bug #12628)
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug #12551, Bug #8724)
- The `cp1250` character set was not supported. (Bug #11621)
- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug #11542)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug #11490)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug #11450)
- MySQL Connector/NET interpreted the new decimal data type as a byte array. (Bug #11294)
- Added support to call a stored function from MySQL Connector/NET. (Bug #10644)
- Connection could fail when .NET thread pool had no available worker threads. (Bug #10637)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug #10281)
- Decimal parameters caused syntax errors. (Bug #10152, Bug #11550, Bug #10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug #9722)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug #8382)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug #7951)
- MySQL Connector/NET could not work properly with certain regional settings. (WL#8228)

#### D.4.10.8. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

**Bugs fixed:**

- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug #7755)
- Quote character \222 not quoted in `EscapeString`. (Bug #7724)
- `GetBytes` is working no more. (Bug #7704)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug #7612)
- Clone method bug in `MySqlCommand`. (Bug #7478)
- Problem with Multiple resultsets. (Bug #7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug #7345)
- `MySqlCommand.Connection` returns an `IDbConnection`. (Bug #7258)
- Calling prepare causing exception. (Bug #7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

**D.4.10.9. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)****Bugs fixed:**

- Invalid query string when using inout parameters (Bug #7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug #7132)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug #7032)
- Exception stack trace lost when re-throwing exceptions. (Bug #6983)
- Errors in parsing stored procedure parameters. (Bug #6902)
- `InvalidCast` when using `DATE_ADD`-function. (Bug #6879)
- `Int64` Support in `MySqlCommand` Parameters. (Bug #6863)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug #6831)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. (Bug #6770)
- Integer "out" parameter from stored procedure returned as string. (Bug #6668)
- An Open Connection has been Closed by the Host System. (Bug #6634)
- Fixed Invalid character set index: 200. (Bug #6547)
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create START MENU items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.

- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

#### D.4.10.10. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

**Bugs fixed:**

- Fixed Objects not being disposed (Bug #6649)
- Fixed Charset-map for UCS-2 (Bug #6541)
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset (Bug #6429)
- Fixed double type handling in `MySqlParameter(string parameterName, object value)`. (Bug #6428)
- Fixed Installation directory ignored using custom installation (Bug #6329)
- Fixed #HY000 Illegal mix of collations (latin1\_swedish\_ci,IMPLICIT) and (utf8\_general\_ (Bug #6322)
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with `MySqlBinary` where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

#### D.4.10.11. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

**Bugs fixed:**

- Fixed `IndexOutOfRangeException` when reading BLOB with `DataReader` with `GetString(index)` (Bug #6230)
- Fixed `GetBoolean` returns wrong values (Bug #6227)
- Fixed `Method TokenizeSql()` uses only a limited set of valid characters for parameters (Bug #6217)
- Fixed NET Connector source missing resx files (Bug #6216)
- Fixed `System.OverflowException` when using `YEAR` data type. (Bug #6036)
- Fixed `MySqlDateTime` sets `IsZero` property on all subseq.records after first zero found (Bug #6006)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) (Bug #5900)
- Fixed missing Reference in `DbType` setter (Bug #5897)

- Fixed Parsing the ';' char (Bug #5876)
- Fixed DBNull Values causing problems with retrieving/updating queries. (Bug #5798)
- IsNullable error (Bug #5796)
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value (Bug #5621)
- Fixed constructor initialize problems in MySqlCommand() (Bug #5613)
- Fixed Yet Another "object reference not set to an instance of an object" (Bug #5496)
- Fixed Can't display Chinese correctly (Bug #5288)
- Fixed MySqlDataReader and 'show tables from ...' behavior (Bug #5256)
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed BUG #5458 Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed BUG #5388 DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed BUG #5602 Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed BUG #5392 MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed BUG #5474 cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD\_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed BUG #5469 Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

#### D.4.10.12. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

**Bugs fixed:**

- Thai encoding not correctly supported. (Bug #3889)
- Bumped version number to 1.0.0 for beta 1 release.

- Removed all of the XML comment warnings.
- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

## D.4.11. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.
- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug#5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader` `GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug#5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added `replacetext` custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to enable use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug#4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug#4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new `.Types` namespace and implementations for most current `MySql` types.

- Added `MySQLField41` as a subclass of `MySQLField`.
- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using `bytefx .net mysql driver` (Bug#4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug#4505)
- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySQLCommandBuilder` fails with multi-word column names. (Bug#4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySQLDataReader.GetBytes` do not work correctly. (Bug#4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting `maxPacketSize` to default value in `Driver.ctor`.
- Setting `MySQLDbType` on a parameter doesn't set generic type. (Bug#4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug#4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Enable reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. (Bug#4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads in-

tegers packed with 2,3,4.

- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug#4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug#3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug#3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug#3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.

- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in `parameter.cs` to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdapter` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

## D.4.12. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlCommand.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to permit it to be used in `MySqlCommand.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is available.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to permit values to come directly from row buffer.
- Changed to use the new `driver.Send` syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

## D.4.13. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year data type now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

#### D.4.14. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.

- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characteraset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the `MySqlPool` (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perken-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perken-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to permit `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).

- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlClient` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split SQL code (thanks everyone!).

## D.4.15. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

## D.4.16. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` data type handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.

- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more `SqlClient` compliant so that `DataReaders` have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where `NextResult` was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to `Int64` and unsigned 16bit values to `Int32`, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of `Command` worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now `MySql` in all files. PostgreSQL is now `PgSql`.
- Added attribute to `PgSql` code to prevent designer from trying to show.
- Added `MySQLDbType` property to `Parameter` object and added proper conversion code to convert from `DbType` to `MySQLDbType`.
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(...)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only permits characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.

- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

## D.4.17. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present.
- Field now uses `typeof` keyword to return `System.Types` (performance).

## D.4.18. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use `xsd` (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

## D.4.19. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib ([www.icsharpcode.net](http://www.icsharpcode.net)).
- Named pipes on Windows now working properly.

- Work done to improve [Timestamp](#) data type handling.
- Implemented [IEnumerable](#) on [DataReader](#) so [DataGrid](#) would work.

## D.4.20. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to [TIMESTAMP](#) and [DATETIME](#) fields fixed.

## D.5. MySQL Visual Studio Plugin Change History

### Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section D.4, "MySQL Connector/NET Change History"](#).

### D.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

#### Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

### D.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

#### Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug #24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug #23071)

### D.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (04 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

This section has no changelog entries.

## D.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (04 October 2006)

### Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

## D.6. MySQL Connector/J Change History

### D.6.1. Changes in MySQL Connector/J 5.1.x

#### D.6.1.1. Changes in MySQL Connector/J 5.1.15 (09 February 2011)

Fixes bugs found since release 5.1.14.

### Bugs fixed:

- Optional logging class `com.mysql.jdbc.log.Log4JLogger` was not included in the source/binary package for 5.1.14.  
5.1.15 will ship with an SLF4J logger (which can then be plugged into Log4J). Unfortunately, it is not possible to ship a direct Log4J integration because the GPL is not compatible with Log4J's license. (Bug #59511, Bug #11766408)
- The hard-coded list of reserved words in Connector/J was not updated to reflect the list of reserved words in MySQL Server 5.5. (Bug #59224)
- `MySqlProcedure` accepted null arguments as parameters, however the JDBC meta data did not indicate that. (Bug #38367, Bug #11749186)
- Using Connector/J to connect from a z/OS machine to a MySQL Server failed when the database name to connect to was included in the connection URL. This was because the name was sent in z/OS default platform encoding, but the MySQL Server expected Latin1.

It should be noted that when connecting from systems that do not use Latin1 as the default platform encoding, the following connection string options can be useful: `passwordCharacterEncoding=ASCII` and `characterEncoding=ASCII`. (Bug #18086, Bug #11745647)

#### D.6.1.2. Changes in MySQL Connector/J 5.1.14 (6th December 2010)

Fixes bugs found since release 5.1.13.

### Functionality added or changed:

- Connector/J's load-balancing functionality only allowed the following events to trigger failover:
  - Transaction commit/rollback
  - CommunicationExceptions
  - Matches to user-defined Exceptions using the `loadBalanceSQLStateFailover`, `loadBalanceSQLExceptionSubclassFailover` or `loadBalanceExceptionChecker` property.

This meant that connections where auto-commit was enabled were not balanced, except for Exceptions, and this was problematic in the case of distribution of read-only work across slaves in a replication deployment.

The ability to load-balance while auto-commit is enabled has now been added to Connector/J. This introduces two new properties:

1. `loadBalanceAutoCommitStatementThreshold` - defines the number of matching statements which will trigger the driver to (potentially) swap physical server connections. The default value (0) retains the previously-established behavior that connections with auto-commit enabled are never balanced.
2. `loadBalanceAutoCommitStatementRegex` - the regular expression against which statements must match. The default value (blank) matches all statements.

Load-balancing will be done after the statement is executed, before control is returned to the application. If rebalancing fails, the driver will silently swallow the resulting Exception (as the statement itself completed successfully). (Bug #55723)

#### Bugs fixed:

- Connection failover left slave/secondary in read-only mode. Failover attempts between two read-write masters did not properly set `this.currentConn.setReadOnly(false)`. (Bug #58706)
- Connector/J mapped both 3-byte and 4-byte UTF8 encodings to the same Java UTF8 encoding.

To use 3-byte UTF8 with Connector/J set `characterEncoding=utf8` and set `useUnicode=true` in the connection string.

To use 4-byte UTF8 with Connector/J configure the MySQL server with `character_set_server=utf8mb4`. Connector/J will then use that setting as long as `characterEncoding` has not been set in the connection string. This is equivalent to autodetection of the character set. (Bug #58232)

- The `CallableStatementRegression` test suite failed with a Null Pointer Exception because the `OUT` parameter in the `I__S.PARAMETERS` table had no name, that is `COLUMN_NAME` had the value `NULL`. (Bug #58232)
- `DatabaseMetaData.supportsMultipleResultSets()` was hard-coded to return `false`, even though Connector/J supports multiple result sets. (Bug #57380)
- Using the `useOldUTF8Behavior` parameter failed to set the connection character set to `latin1` as required.

In versions prior to 5.1.3, the handshake was done using `latin1`, and while there was logic in place to explicitly set the character set after the handshake was complete, this was bypassed when `useOldUTF8Behavior` was true. This was not a problem until 5.1.3, when the handshake was modified to use `utf8`, but the logic continued to allow the character set configured during that handshake process to be retained for later use. As a result, `useOldUTF8Behavior` effectively failed. (Bug #57262)

- Invoking a stored procedure containing output parameters by its full name, where the procedure was located in another database, generated the following exception:

```
Parameter index of 1 is out of range (1, 0)
```

(Bug #57022)

- When a JDBC client disconnected from a remote server using `Connection.close()`, the TCP connection remained in the `TIME_WAIT` state on the server side, rather than on the client side. (Bug #56979)
- Leaving `Trust/ClientCertStoreType` properties unset caused an exception to be thrown when connecting with `useSSL=true`, as no default was used. (Bug #56955)
- When load-balanced connections swap servers, certain session state was copied from the previously active connection to the newly-selected connection. State synchronized included:
  - Auto-commit state
  - Transaction isolation state
  - Current schema/catalog

However, the read-only state was not synchronized, which caused problems if a write was attempted on a read-only connection. (Bug #56706)

- When using Connector/J configured for failover (`jdbc:mysql://host1,host2,...` URLs), the non-primary servers re-balanced when the transactions on the master were committed or rolled-back. (Bug #56429)

- An unhandled Null Pointer Exception (NPE) was generated in `DatabaseMetaData.java` when calling an incorrectly cased function name where no permission to access `mysql.proc` was available.

In addition to catching potential NPEs, a guard against calling JDBC functions with `db_name.proc_name` notation was also added. (Bug #56305)

- Attempting to use JDBC4 functions on `Connection` objects resulted in errors being generated:

```
Exception in thread "main" java.lang.AbstractMethodError:
com.mysql.jdbc.LoadBalancedMySQLConnection.createBlob()Ljava/sql/Blob;
    at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
    at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39)

    at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:476)
    at $Proxy0.createBlob(Unknown Source)
```

(Bug #56099)

### D.6.1.3. Changes in MySQL Connector/J 5.1.13 (24 June 2010)

Fixes bugs found since release 5.1.12.

#### Functionality added or changed:

- Connector/J did not support `utf8mb4` for servers 5.5.2 and newer.

Connector/J now auto-detects servers configured with `character_set_server=utf8mb4` or treats the Java encoding `utf-8` passed using `characterEncoding=...` as `utf8mb4` in the `SET NAMES=` calls it makes when establishing the connection. (Bug #54175)

#### Bugs fixed:

- The method `unsafeStatementInterceptors()` contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. (Bug #53041)
- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. (Bug #52534)
- Logic in implementations of `LoadBalancingConnectionProxy` and `LoadBalanceStrategy` behaved differently as to which `SQLExceptions` trigger failover to a new host. The former looked at the first two characters of the `SQLState`:

```
if (sqlState.startsWith("08"))
...
```

The latter used a different test:

```
if (sqlEx instanceof CommunicationsException
    || "08S01".equals(sqlEx.getSQLState())) {
...
```

This meant it was possible for a new `Connection` object to throw an `Exception` when the first selected host was unavailable. This happened because `MySQLIO.createNewIO()` could throw an `SQLException` with a `SQLState` of "08001", which did not trigger the "try another host" logic in the `LoadBalanceStrategy` implementations, so an `Exception` was thrown after having only attempted connecting to a single host. (Bug #52231)

- In the file `DatabaseMetadata.java`, the function `private void getCallStmtParameterTypes` failed if the parameter was defined over more than one line by using the `'\n'` character. (Bug #52167)
- The catalog parameter, `PARAM_CAT`, was not correctly processed when calling for metadata with `getMetaData()` on stored procedures. This was because `PARAM_CAT` was hardcoded in the code to `NULL`. In the case where `nullcatalogmeanscurrent` was `true`, which is its default value, a crash did not occur, but the metadata returned was for the stored procedures from the catalog

currently attached to. If, however, `nullcatalogmeanscurrent` was set to `false` then a crash resulted.

Connector/J has been changed so that when `NULL` is passed as `PARAM_CAT` it will not crash when `nullcatalogmeanscurrent` is `false`, but rather iterate all catalogs in search of stored procedures. This means that `PARAM_CAT` is no longer hardcoded to `NULL` (see Bug #51904). (Bug #51912)

- A load balanced `Connection` object with multiple open underlying physical connections rebalanced on `commit()`, `rollback()`, or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with `"/ * ping */`, to ensure they remained active. This meant that calls to `Connection.commit()` could throw a `SQLException`. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. (Bug #51783)
- The `rollback()` method could fail to rethrow a `SQLException` if the server became unavailable during a rollback. The errant code only rethrew when `ignoreNonTxTables` was true and the exception did not have the error code 1196, `SQLException.ER_WARNING_NOT_COMPLETE_ROLLBACK`. (Bug #51776)
- When the `allowMultiQueries` connection string option was set to `true`, a call to `Statement.executeBatch()` scanned the query for escape codes, even though `setEscapeProcessing(false)` had been called previously. (Bug #51704)
- When a `StatementInterceptor` was used and an alternate `ResultSet` was returned from `preProcess()`, the original statement was still executed. (Bug #51666)
- Objects created by `ConnectionImpl`, such as prepared statements, hold a reference to the `ConnectionImpl` that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the `PreparedStatement`. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. (Bug #51643)
- `jdbc:mysql:loadbalance://` would connect to the same host, even though `loadBalanceStrategy` was set to a value of `random`, and multiple hosts were specified. (Bug #51266)
- An unexpected exception when trying to register `OUT` parameters in `CallableStatement`.

Sometimes Connector/J was not able to register `OUT` parameters for `CallableStatements`. (Bug #43576)

#### D.6.1.4. Changes in MySQL Connector/J 5.1.12 (18 February 2010)

Fixes bugs found since release 5.1.11.

##### Bugs fixed:

- The catalog parameter was ignored in the `DatabaseMetaData.getProcedure()` method. It returned all procedures in all databases. (Bug #51022)
- A call to `DatabaseMetaData.getDriverVersion()` returned the revision as `mysql-connector-java-5.1.11 (Revision: ${svn.Revision})`. The variable `${svn.Revision}` was not replaced by the SVN revision number. (Bug #50288)

#### D.6.1.5. Changes in MySQL Connector/J 5.1.11 (21 January 2010)

Fixes bugs found since release 5.1.10.

##### Functionality added or changed:

- Replication connections, those with URLs that start with `jdbc:mysql:replication`, now use a `jdbc:mysql:loadbalance` connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklistTimeout` and `loadBalanceStrategy` to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. (Bug #49537)

##### Bugs fixed:

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. (Bug #50288)
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multibyte character set. (Bug #49745)
- For pooled connections, Connector/J did not process the session variable `time_zone` when set using the URL, resulting in incorrect timestamp values being stored. (Bug #49700)
- The `ExceptionHandler` class did not provide a `Connection` context. (Bug #49607)
- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. (Bug #48605)
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource
Caused by: java.lang.ClassCastException: $Proxy0
    at
com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2
    at com.mysql.jdbc.jdbc2.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

(Bug #48486)

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. (Bug #48442)
- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for “VALUES ” (with trailing space). However, valid MySQL syntax permits `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES
(1);

INSERT INTO tbl VALUES(1);
```

Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. (Bug #48172)

- A PermGen memory leaked was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. (Bug #36565)
- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

(Bug #32525)

### D.6.1.6. Changes in MySQL Connector/J 5.1.10 (23 September 2009)

Fixes bugs found since release 5.1.9.

#### Bugs fixed:

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. (Bug #47494)

### D.6.1.7. Changes in MySQL Connector/J 5.1.9 (21 September 2009)

#### Bugs fixed:

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalTxToPhysicalConnection=true`, there is a static map (`XIDS_TO_PHYSICAL_CONNECTIONS`) that tracks the `Xid` with the `XAConnection`, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. (Bug #46925)
- When using the ON DUPLICATE KEY UPDATE functionality together with the `rewriteBatchedStatements` option set to true, an exception was generated when trying to execute the prepared statement:

```
INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
```

The exception generated was:

```
java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is
2).
    at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
    ....
Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters,
which is 2).
    at com.mysql.jdbc.SQLException.createSQLException(SQLException.java:1055)
    at com.mysql.jdbc.SQLException.createSQLException(SQLException.java:956)
    at com.mysql.jdbc.SQLException.createSQLException(SQLException.java:926)
    at com.mysql.jdbc.PreparedStatement.checkBounds(PreparedStatement.java:3657)
    at com.mysql.jdbc.PreparedStatement.setInternal(PreparedStatement.java:3641)
    at
com.mysql.jdbc.PreparedStatement.setBytesNoEscapeNoQuotes(PreparedStatement.java:3391)
    at
com.mysql.jdbc.PreparedStatement.setOneBatchedParameterSet(PreparedStatement.java:4203)
    at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1759)
    at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1441)
    at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
    ... 16 more
```

(Bug #46788)

- When Connector/J encountered an error condition that caused it to create a `CommunicationsException`, it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

```
The last packet successfully received from the server was 1,249,932,468,916 milliseconds
ago. The last packet sent successfully to the server was 0 milliseconds ago.
```

(Bug #46637)

- The `getSuperTypes` method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be `TYPE_CAT` and that of the second column `TYPE_SCHEM`. The method however returned the names as `TABLE_CAT` and `TABLE_SCHEM` for first and second column respectively. (Bug #44508)
- `SQLException` for data truncation error gave the error code as 0 instead of 1265. (Bug #44324)
- Calling `ResultSet.deleteRow()` on a table with a primary key of type `BINARY(8)` silently failed to delete the row, but only in some repeatable cases. The generated `DELETE` statement generated corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. (Bug #43759)
- Accessing result set columns by name after the result set had been closed resulted in a `NullPointerException` instead of a `SQLException`. (Bug #41484)
- `QueryTimeout` did not work for batch statements waiting on a locked table.

When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. (Bug #34555)

- The `parseURL` method in class `com.mysql.jdbc.Driver` did not work as expected. When given a URL such as `"jdbc:mysql://www.mysql.com:12345/my_database"` to parse, the property `PORT_PROPERTY_KEY` was found to be `null` and the

`HOST_PROPERTY_KEY` property was found to be “www.mysql.com:12345”.

### Note

Connector/J has been fixed so that it will now always fill in the `PORT` property (using 3306 if not specified), and the `HOST` property (using `localhost` if not specified) when `parseURL()` is called. The driver also parses a list of hosts into `HOST.n` and `PORT.n` properties as well as adding a property `NUM_HOSTS` for the number of hosts it has found. If a list of hosts is passed to the driver, `HOST` and `PORT` will be set to the values given by `HOST.1` and `PORT.1` respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

(Bug #32216)

- Attempting to delete rows using `ResultSet.deleteRow()` did not delete rows correctly. (Bug #27431)
- The `setDate` method silently ignored the `Calendar` parameter. The code was implemented as follows:

```
public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {  
    setDate(parameterIndex, x);  
}
```

From reviewing the code it was apparent that the `Calendar` parameter `cal` was ignored. (Bug #23584)

## D.6.1.8. Changes in MySQL Connector/J 5.1.8 (16 July 2009)

### Bugs fixed:

- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```
SQLException.createLinkFailureMessageBasedOnHeuristics(  
    (ConnectionImpl) this.conn,  
    System.currentTimeMillis() - 1000,  
    System.currentTimeMillis() - 2000,  
    e,  
    false);
```

returned the following string:

```
The last packet successfully received from the server  
was 2 milliseconds ago. The last packet sent successfully to the  
server was 1 milliseconds ago.
```

(Bug #45419)

- Calling `Connection.serverPrepareStatement()` variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely `TYPE_SCROLL_SENSITIVE`. (Bug #45171)
- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug #44869)
- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44868)
- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug #44867)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44865)
- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third

column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44863)

- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44862)
- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

In the `CommunicationsException` code:

```
private boolean streamingResultSetInPlay = false;

public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
    long lastPacketReceivedTimeMs, Exception underlyingException) {

    this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
        lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
        this.streamingResultSetInPlay);
```

`streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
    exceptionMessageBuf.append(
        Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
} else {
    ...
```

(Bug #44588)

- The `SQLError.createLinkFailureMessageBasedOnHeuristics()` method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

Information about when the last packet was successfully received should be provided in all cases. (Bug #44587)

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug #44056)
- Using `useInformationSchema` with `DatabaseMetaData.getExportedKeys()` generated the following exception:

```
com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
'REFERENCED_TABLE_NAME' in where clause is ambiguous
...
at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)
at com.mysql.jdbc.PreparedStatement.executeQuery(PreparedStatement.java:1923)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
DatabaseMetaDataUsingInfoSchema.java:50)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
DatabaseMetaDataUsingInfoSchema.java:603)
```

(Bug #43714)

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

`LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug #43421)

- The method `Statement.getGeneratedKeys()` did not return values for `UNSIGNED BIGINTS` with values greater than `Long.MAX_VALUE`.

Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return `BigIntegers` for the result set returned from `getGeneratedKeys()`, it will only return them if the value is greater than `Long.MAX_VALUE`. If your application needs this consistency, it will need to check the class of the return value from `getObject()` on the `ResultSet` returned by `Statement.getGeneratedKeys()` and if it is not a `BigInteger`, create one

based on the `java.lang.Long` that is returned. (Bug #43196)

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug #43071)
- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug #43070)
- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

```
java.lang.StringIndexOutOfBoundsException: String index out of range: -1
at java.lang.String.substring(String.java:1938)
at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1524)
```

(Bug #42253)

- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
at java.util.HashMap$KeyIterator.next(Unknown Source)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
```

(Bug #42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug #41730)
- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recognized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

For example, consider the following statement:

```
String sql = "-- Customer's zip code will be fixed\n" +
"update address set zip_code = 99999\n" +
"where not regexp '^([0-9]{5}([[-.]))?([0-9]{4})?$$'";
```

When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

```
-- Customer's zip code will be fixed
update address set zip_code = '99999'
where not regexp '^([0-9]([[-.]))?([0-9])?$$'
```

(Bug #41566)

- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

#### Note

The performance regression in `indexOfIgnoreCaseRespectMarker()` has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug #41532)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

```
java.lang.NullPointerException
at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)
at org.apache.commons.dbcp.DelegatingResultSet.getShort(DelegatingResultSet.java:219)
at com.zimbra.cs.db.DbVolume.constructVolume(DbVolume.java:297)
at com.zimbra.cs.db.DbVolume.get(DbVolume.java:197)
at com.zimbra.cs.db.DbVolume.create(DbVolume.java:95)
at com.zimbra.cs.store.Volume.create(Volume.java:227)
at com.zimbra.cs.store.Volume.create(Volume.java:189)
at com.zimbra.cs.service.admin.CreateVolume.handle(CreateVolume.java:48)
at com.zimbra.soap.SoapEngine.dispatchRequest(SoapEngine.java:428)
at com.zimbra.soap.SoapEngine.dispatch(SoapEngine.java:285)
```

(Bug #41484)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

```
PreparedStatement ps = connection.prepareStatement("INSERT INTO table
values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);
```

(Bug #41448)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

```
Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not have been generated. (Bug #41416)

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. (Bug #41269)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERTs`. (Bug #41161)
- Error message strings contained variable values that were not expanded. For example:

```
Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

(Bug #40772)

- When using `rewriteBatchedStatements=true` with:

```
INSERT INTO table_name_values (...) VALUES (...)
```

Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

```
testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an
error in your SQL syntax; check the manual that corresponds to your MySQL server version
for the right syntax to use near 'values (2,'toto',2),(id,data, odr) values (' at line 1
(3,'toto',3),(id,data, odr) values (' at line 1

```

(Bug #40439)

- A statement interceptor received the incorrect parameters when used with a batched statement. (Bug #39426)

- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[]` for following:

```
SELECT TRIM(rowid) FROM tbl
```

Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[]` was returned.

Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. (Bug #38387)

### D.6.1.9. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

#### Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

#### Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug #42309)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALLs` to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug #40031)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug #39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug #39956)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug #39911)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

```
int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue();
```

This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug #39784)

- When configuring the Java Replication Driver the last slave specified was never used. (Bug #39611)
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug #39352)
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug #38782)
- Connector/J threw the following exception when using a read-only connection:

```
java.sql.SQLException: Connection is read-only. Queries leading to data modification are not allowed.
```

(Bug #38747)

- Connector/J was unable to connect when using a non-`latin1` password. (Bug #37570)
- The `useOldAliasMetadataBehavior` connection property was ignored. (Bug #35753)
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug #35170)
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug #34185)
- The `loadBalance bestResponseTime` blacklists did not have a global state. (Bug #33861)

### D.6.1.10. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

#### Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. (Bug #33678)
- XAConnections and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible using the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.

#### Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug #36830)
- When trying to read `Time` values like "00:00:00" with `ResultSet.getTime(int)` an exception is thrown. (Bug #36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug #35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug #35666)
- When using the keyword "loadbalance" in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug #35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug #35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug #35489)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:  

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

  
followed by the text of the stored function starting after the argument list. (Bug #35199)
- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

```
SELECT column AS aliasName from table
```

(Bug #35150)

- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from `ConnectionProperties` are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug #34937)
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMPS` when using server-side prepared statements (not enabled by default). (Bug #34913)
- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug #34762)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug #34703)
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. (Bug #34677)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug #34518)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug #34194)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug #34093)
- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug #33823)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug #33734)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug #33594)
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug #33162)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name using the `loadBalanceStrategy` configuration property. (Bug #32877)

- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values, as the hours end up being the same when sent as the literal that MySQL requires.

Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

This bug fix also fixes BUG#15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) (Bug #32577, Bug #15604)

- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver then hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal `SELECT`s won't have an error in this spot in the protocol unless an I/O error occurs. (Bug #32246)

- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug #32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBoundsException` exception when setting the last parameter to null. (Bug #31823)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug #31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug #31192)
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug #31053)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug #30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug #20491)
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED\_KEY" as in 5.0.x.

#### D.6.1.11. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

##### Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than  $5 * \text{stddev}$  of the mean query time (outside the 96% percentile).

##### Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #28256)
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp( cal.getTimeInMillis() );
ps.setTimestamp( N, t, cal );
```

(Bug #15604)

#### D.6.1.12. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

This section has no changelog entries.

### D.6.1.13. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 [NCHAR](#), [NVARCHAR](#) and [NCLOB](#) types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using [SHOW PROCESSLIST](#) on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

#### Functionality added or changed:

- Connector/J now connects using an initial character set of [utf-8](#) solely for the purpose of authentication to permit user names or database names in any character set to be used in the JDBC connection URL. (Bug #29853)
- Added two configuration parameters:
  - [blobsAreStrings](#): Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for [GROUP BY](#) clauses. Defaults to false.
  - [functionsNeverReturnBlobs](#): Should the driver always treat data from functions returning [BLOBs](#) as Strings. Added specifically to work around dubious metadata returned by the server for [GROUP BY](#) clauses. Defaults to false.
- Setting [rewriteBatchedStatements](#) to [true](#) now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client/server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has [BLOB](#) or [TEXT](#) types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property [largeRowSizeThreshold](#), which has a default value of 2KB.
- The data (and how it is stored) for [ResultSet](#) rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" through the [com.mysql.jdbc.StatementInterceptor](#) interface, examples are in [com/mysql/jdbc/interceptors](#). Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable [net\\_write\\_timeout](#) when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named [netTimeoutForStreamingResults](#), with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the [DriverManager](#) through the service provider mechanism, standardized Connection validity checks and categorized [SQLExceptions](#) based on recoverability/retry-ability and class of the underlying error.
- [Statement.setQueryTimeout\(\)](#)s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during [Statement/PreparedStatement/CallableStatement.executeBatch\(\)](#) when [rewriteBatchStatements](#) has been set to [true](#) now return [BatchUpdateExceptions](#) according to the setting of [continueBatchOnError](#).

If [continueBatchOnError](#) is set to [true](#), the update counts for the "chunk" that were sent as one unit will all be set to [EX-](#)

`ECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the [BatchUpdateException](#).

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on `com.mysql.jdbc.Statement`: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

#### Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug #30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from sub-queries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #29852)
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug #29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug #28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as `IN` parameters but permit callers to call `registerOutParameter()` on them without throwing an exception. (Bug #28689)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version  $\geq 4.1$ . (Bug #27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping */"` \_exactly\_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

#### D.6.1.14. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

##### Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by  `";"`) if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

#### D.6.1.15. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

##### Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `lar-`

`getRowSizeThreshold`, which has a default value of 2KB.

- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be rewritten in the form `CALL (...); CALL (...); ...` to send the batch in as few client/server round trips as possible.

### D.6.1.16. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

**Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

#### Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

#### Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

#### Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the `SQLState` class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR/NVARCHAR` types.
- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `SQLXML` interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- `com.mysql.jdbc.java6.rt.jar`: Full path to your Java-6 `rt.jar` file
- New feature—driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value 0 means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided using `Connection.getClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rt.jar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

## D.6.2. Changes in MySQL Connector/J 5.0.x

### D.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

#### Functionality added or changed:

- `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

#### Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

If the driver gives up, it will throw the last-received `SQLException`. (Bug #31053)

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug #30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #30851)

- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from sub-queries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #29852)
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug #29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug #28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as `IN` parameters but permit callers to call `registerOutParameter()` on them without throwing an exception. (Bug #28689)

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #28256)
- `UNSIGNED` types not reported using `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly using `DBMD.getColumns()`. (Bug #27916)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #27867)
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug #27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version  $\geq 4.1$ . (Bug #27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping */"` \_exactly\_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

### D.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

#### Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in `EOFExceptions` thrown out of `MysqlIO` (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?

- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to enable tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
  - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that enable Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a `Statement` or `ResultSet`) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires `JDK >= 1.5`)?

**Note**

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

**Bugs fixed:**

- Don't send any file data in response to `LOAD DATA LOCAL INFILE` if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. (Bug #29605)
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '-' single-line comments. (Bug #28956)
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. (Bug #28851)
- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECTs` for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. (Bug #28469)

### D.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

#### Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at [ReplicationConnection](#) or [lbpool](#)).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

#### Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set with `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

#### Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). (Bug #28085)
- `Connection.getTransactionIsolation()` uses `"SHOW VARIABLES LIKE"` which is very inefficient on MySQL-5.0+ servers. (Bug #27655)
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). (Bug #27655)
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

#### Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

(Bug #27400)

- `ResultSet.get*()` with a column index < 1 returns misleading error message. (Bug #27317)
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug #27317)
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug #26959)
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug #26789)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug #26592)
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata

during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug #26173)

- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug #25715)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug #25624)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug #25545)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug #25517)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug #25328)

#### D.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

##### Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable using `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

##### Bugs fixed:

- Connection property `socketFactory` wasn't exposed using correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug #26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug #25836)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug #25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug #25514)

- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug #25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug #25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. (Bug #25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them using `ResultSetMetaData`. (Bug #25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug #25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug #25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug #25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug #24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug #24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug #24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug #24360)
- Calendars and timezones are now lazily instantiated when required. (Bug #24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. This occurred due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug #24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug #24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug #23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug #23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug #23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug #22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug #21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug #21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug #21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for

every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug #21267)

- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

#### Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatement`s weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This enables us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

### D.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

#### Bugs fixed:

- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the SET type, now returns length of largest possible set disregarding whitespace or the `","` delimiters to be consistent with the ODBC driver. (Bug #22613)
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. (Bug #22456)
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. (Bug #22359)
- Workaround for server crash when calling stored procedures using a server-side prepared statement (driver now detects pre-prepare(stored procedure) and substitutes client-side prepared statement). (Bug #22297)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side pre-

pared statement). (Bug #22290)

- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug #22024)
- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer` as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. (Bug #21544)
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column ()" exceptions. (Bug #21379)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- `DatabaseMetaData` correctly reports `true` for `supportsCatalog*()` methods.
- Driver now supports `{call sp}` (without "()") if procedure has no arguments).

#### D.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

##### Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies using `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

##### Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug #20650)
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug #20650)

#### D.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

##### Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now permits combinations of `XAResource.TMSTARTSCAN` and `TMENDRSCAN`. To simulate the "scanning" nature of the interface, we return all prepared XIDs for `TMSTARTSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug #20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug #20242)
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This enables the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug #20242)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. (Bug #20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug #19169)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's

`latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. (Bug #18086)

- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug #17401)

### D.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

This section has no changelog entries.

### D.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

#### Bugs fixed:

- Added support for Connector/MXJ integration using url subprotocol `jdbc:mysql:mxj://...` (Bug #14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug #14729)
- When fix for Bug#14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug #14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug #14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec permits it anyways), part of fix to Bug#14972). (Bug #14729)
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug #14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `'', (int)0` was being used as an argument indirectly using method return value. This signature doesn't exist prior to Java5.) (Bug #14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug #14729)

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug #14729)
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADataSource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Do not permit `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnNames()` if the column was aliased, alias name for `.getColumnLabel()`

(if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.

- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

## D.6.3. Changes in MySQL Connector/J 3.1.x

### D.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

**Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

**Bugs fixed:**

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug #24840)

### D.6.3.2. Changes in MySQL Connector/J 3.1.14 (19 October 2006)

**Bugs fixed:**

- Check and store value for `continueBatchOnError` property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause `NullPointerExceptions` when it is required to check this property. (Bug #22290)
- Fixed BUG#18258 - `DatabaseMetaData.getTables()`, `columns()` with bad catalog parameter threw exception rather than return empty result set (as required by spec). (Bug #22290)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'. (Bug #22290)
- Fixed bug where driver would not advance to next host if `roundRobinLoadBalance=true` and the last host in the list is down. (Bug #22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug #22290)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug #22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to `STDERR`. (Bug #21207)
- `DDriver` throws `NPE` when tracing prepared statements that have been closed (in `asSQL()`). (Bug #21207)
- `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`. (Bug #21062)
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (that is, " or "). (Bug #20888)

- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug #20687)
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Bug #20485)
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. (Bug #20479)
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. (Bug #20306)
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. (Bug #19993)
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. (Bug #19993)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug #19726)
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX\_VALUE. (Bug #18880)
- Fixed memory leak with profileSQL=true. (Bug #16987)
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddr with null content. (Bug #16791)

### D.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

#### Bugs fixed:

- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of BigDecimals. (Bug #19615)
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug #19282)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. (Bug #19282)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug #19282)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug #18740)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug #18554)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug #18496)
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. (Bug #18041)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug #18041)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug #17898)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug #17587)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug #17587)
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties. (Bug #17587)
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done using conversion for server-side prepared statements. (Bug #17450)

- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug #17099)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug #16841)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug #15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug #15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug #15570)
- No "dos" character set in MySQL > 4.1.0. (Bug #15544)
- `INOUT` parameter does not store `IN` value. (Bug #15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `getObject()` on an `UNSIGNED LONG` type). (Bug #15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug #14938)
- Exception thrown for new decimal type when using updatable result sets. (Bug #14609)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently. (Bug #13601)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug #13469)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.  
  
If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug #13469)
- LogFactory now prepends `com.mysql.jdbc.log` to the log class name if it cannot be found as specified. This enables you to use "short names" for the built-in log factories, for example, `logger=CommonsLogger` instead of `logger=com.mysql.jdbc.log.CommonsLogger`. (Bug #13469)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug #11874)

#### D.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

##### Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug #15141)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug #15065)
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`s. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). (Bug #15024)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug #14972)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug #14938)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug #14909)

- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug #14815)
- `storesMixedCaseIdentifiers()` returns `false` (Bug #14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug #14562)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug #14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`(Bug #14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug #14562)
- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- If `lower_case_table_names=1` (on server):
  - `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`(Bug #14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
  - If `lower_case_table_names=0` (on server):
    - `storesLowerCaseIdentifiers()` returns `false`
    - `storesLowerCaseQuotedIdentifiers()` returns `false`
    - `storesMixedCaseIdentifiers()` returns `true`
    - `storesMixedCaseQuotedIdentifiers()` returns `true`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
  - If `lower_case_table_names=1` (on server):
    - `storesLowerCaseIdentifiers()` returns `true`

- `storesLowerCaseQuotedIdentifiers()` returns `true`
- `storesMixedCaseIdentifiers()` returns `false`
- `storesMixedCaseQuotedIdentifiers()` returns `false`
- `storesUpperCaseIdentifiers()` returns `false`
- `storesUpperCaseQuotedIdentifiers()` returns `true`

(Bug #14562)

- `storesMixedCaseIdentifiers()` returns `true` (Bug #14562)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug #14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug #14562)
- `storesLowerCaseIdentifiers()` returns `false` (Bug #14562)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug #14562)
- Extraneous sleep on `autoReconnect`. (Bug #13775)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug #13255)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug #13048)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug #12975)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug #12975)
- `logSlowQueries` should give better info. (Bug #12230)
- Don't increase timeout for failover/reconnect. (Bug #6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Do not permit `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

### D.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

#### Bugs fixed:

- The configuration property `sessionVariables` now permits you to specify variables that start with the “@” sign. (Bug #13453)
- URL configuration parameters do not permit “&” or “=” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).

If the “%” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “%”

when using application/x-www-form-urlencoded encoding. (Bug #13453)

- Workaround for Bug#13374: `ResultSet.createStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed using `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug #13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug #13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug #13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` is not technically permitted by the JDBC specification, but we have historically permitted it). (Bug #13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. (Bug #13277)
- Read response in `MySQLIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug #13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug #13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug #12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug #12970)
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug #12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug #12752)
- `getExportedKeys()` (Bug #12541)
- Specifying a catalog works as stated in the API docs. (Bug #12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug #12541)
- `getIndexInfo()` (Bug #12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug #12541)
- `getImportedKeys()` (Bug #12541)
- Specifying `" "` means "current" catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug #12541)
- `getCrossReference()` (Bug #12541)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug #12541)
- `getColumns()` (Bug #12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`

- `getExportedKeys()`
- `getImportedKeys()`
- `getIndexInfo()`
- `getPrimaryKeys()`
- `getProcedures()` (and thus indirectly `getProcedureColumns()`)
- `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

(Bug #12541)

- `getBestRowIdentifier()` (Bug #12541)
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug #12541)
- `getTables()` (Bug #12541)
- `getPrimaryKeys()` (Bug #12541)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug #12417)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug #12229)
- Properties shared between master and slave with replication connection. (Bug #12218)
- Geometry types not handled with server-side prepared statements. (Bug #12104)
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug #11976)
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug #11879)
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug #11798)
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. (Bug #11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug #11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug #11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `send-BlobChunkSize` which is 1M. (Bug #11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. (Bug #11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. (Bug #11663)

- Moved source code to Subversion repository. (Bug #11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug #11663)
- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug #11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug #11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug #11614)
- `DBMD.supportsLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug #11575)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths  $> \text{Integer.MAX\_VALUE}$ . (Bug #11498)
- Escape processor didn't honor strings demarcated with double quotation marks. (Bug #11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions  $> 4.1$ , `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug #11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as *all* streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug #11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug #11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug #11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug #10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug #10630)

#### D.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

##### Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

#### D.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

##### Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug #11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug #11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug #11360)
- Connector/J dumping query into `SQLException` twice. (Bug #11360)
- `autoReconnect` ping causes exception on connection startup. (Bug #11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug #11115)
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality (Bug #11115)

- `maxPerformance`: Maximum performance without being reckless (Bug #11115)
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can (Bug #11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug #11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug #11115)
- Added the following configuration bundles, use one or many using the `useConfigs` configuration property:
  - `maxPerformance`: Maximum performance without being reckless
  - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality(Bug #11115)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a "Connection closed" exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug #10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug #10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug #10850)
- 0-length streams not sent to server when using server-side prepared statements. (Bug #10850)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug #10850)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug #10496)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug #10496)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug #10496)
- The data type returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug #10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Date` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTs`. (Bug #10485)
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug #10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug #10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug #10155)
- Double quotation marks not recognized when parsing client-side prepared statements. (Bug #10155)

- Made JDBC2-compliant wrappers public to enable access to vendor extensions. (Bug #10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug #10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug #10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug #10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug #10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug #10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug #10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug #9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

#### D.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

##### Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug #9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug #9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug #9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug #9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug #9778)
- Should accept `null` for name patterns in DBMD (meaning "%"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug #9769)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug #9704)
- The logging system is now automatically configured. If the value has been set by the user, using the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
  1. Log4j, if it is available,
  2. Then JDK1.4 logging,
  3. Then fallback to our `STDERR` logging.(Bug #9704)
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug #9704)

- Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. (Bug #9682)
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug #9682)
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MySQLConnectionTester`. (Bug #9320)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug #9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug #9320)
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug #9320)
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug #9320)
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug #9319)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug #9319)
- A continuation of Bug #8868, where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n)` `CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug #9236)
- Cannot use `UTF-8` for `characterSetResults` configuration property. (Bug #9206)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug #9040)
- `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug #8868)
- `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. (Bug #8868)
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug #8868)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug #8868)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug #8868)
- Check for empty strings (‘ ’) when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyString-sConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug #8803)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug #8803)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug #8800)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug #8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.

- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

### D.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

#### Bugs fixed:

- `PreparedStatement` not creating streaming result sets. (Bug #8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug #8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug #8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug #8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug #8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug #8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug #8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. (Bug #8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug #8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug #8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug #7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug #7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug #7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). (Bug #7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug #7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug #7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #7686)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. (Bug #4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug #4718)

- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug #4718)
- By default, the driver now scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug #4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug #4718)
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug #4718)
- Fixed bug with `Connection` not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug #4718)

#### D.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

**Bugs fixed:**

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug #7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

#### D.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

**Bugs fixed:**

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server. (Bug #6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug #6537)
- Use `DatabaseMetaData.getIdentiferQuoteString()` when building DBMD queries. (Bug #6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug #6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable using `autoDeserialize` property (defaults to `false`). (Bug #6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug #6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug #6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug #6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug #6359. (Bug #6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug #6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug #6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug #6359. (Bug #6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug #5729)

- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for nonnumeric values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug #5706)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug #5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug #5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatement`s (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug #5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql\_stmt\_execute()". (Bug #5235)
- Handle case when string representation of timestamp contains trailing "." with no numbers following it. (Bug #5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug #5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales "override" case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

### D.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

#### Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MySQLIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatement`s throwing `ArrayIndexOutOfBoundsException`s. (Bug #5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug #5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug #5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug #5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug #5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug #5032)
- `ServerPreparedStatement`s dealing with return of `DECIMAL` type don't work. (Bug #5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug #4689)
- `ResultSet.isNull()` does not work for primitives if a previous `null` was returned. (Bug #4689)
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes using `useFastIntParsing=false` property. (Bug #4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's "standard" description, followed by the server's error message).

This property is set to `true` by default. (Bug #4642)

- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug #4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` - `> Buffer.readShort()`). (Bug #4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug #4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug #4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug #4482)

### D.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

#### Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug #4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug #4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug #4311)
- Externalized more messages (on-going effort). (Bug #4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug #4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to `SQLStates` that the driver uses (for documentation purposes). (Bug #4119)
- Added packet debugging code (see the `enablePacketDebug` property documentation). (Bug #4119)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug #4119)
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

### D.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

#### Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug #3804)
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug #3804)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug #3540)
- `getProcedures()` does not return any procedures in result set. (Bug #3539)
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1. (Bug #3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug #3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug #3520)

- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug #3146)
- Cleaned up detection of server properties. (Bug #3146)
- Correctly detect initial character set for servers  $\geq 4.1.0$ . (Bug #3146)
- Support placeholder for parameter metadata for server  $\geq 4.1.2$ . (Bug #3146)
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching using `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

### D.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

#### Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug #2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug #2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug #2671)
- Fixed `ConnectionProperties` that weren't properly exposed through accessors, cleaned up `ConnectionProperties` code. (Bug #2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug #2623)
- Merged unbuffered input code from 3.0. (Bug #2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug #2606)
- Server-side prepared statements were not returning data type `YEAR` correctly. (Bug #2606)
- Fixed charset conversion issue in `getTables()`. (Bug #2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug #2502)
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. (Bug #2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug #2359)

- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. (Bug #2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug #2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug #2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug #1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. (Bug #1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug #1673)
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug #1673)
- Fixed sending of queries larger than 16M. (Bug #1673)
- Merged fix of data type mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug #1673)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug #1673)
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug #1673)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug #1673)
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug #1673)
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions  $\geq 5.0.0$
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL  $\geq 4.0.14$  or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profile-fileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).

- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `Data-Source` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

### D.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

#### Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

## D.6.4. Changes in MySQL Connector/J 3.0.x

### D.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

#### Bugs fixed:

- Workaround for server Bug#9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug #8812)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug #8812)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug #8629)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later. (Bug #8629)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug #8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug #8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug #8064)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #7952)
- Backported `SQLState` codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it

defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug #7686)

- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #7686)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug #7607)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug #7601)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #7601)
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. (Bug #7601)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug #7316)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug #7081)
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug #7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug #7081)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #7061)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug #7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug #6966)
- Adding `CP943` to aliases for `sjis`. (Bug #6549, Bug #7607)
- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. (Bug #5874)

#### D.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

##### Bugs fixed:

- Made `TINYINT(1)` -> `BIT/Boolean` conversion configurable using `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). (Bug #5664)
- Off-by-one bug in `Buffer.readString(string)`. (Bug #5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug #5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug #5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug #5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. (Bug #5664)
- Only set `character_set_results` during connection establishment if server version  $\geq$  4.1.1. (Bug #5664)
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

#### D.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

**Bugs fixed:**

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug #5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug #5069)
- Parse new time zone variables from 4.1.x servers. (Bug #5069)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug #5022)
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug #4880)
- “Production” is now “GA” (General Availability) in naming scheme of distributions. (Bug #4860, Bug #4138)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug #4860, Bug #4138)
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug #4808)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug #4742)
- Added FLOSS license exemption. (Bug #4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug #4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

**Warning**

This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

(Bug #4334)

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug #4334)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug #4010)

#### D.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

**Bugs fixed:**

- Fixed URL parsing error.

#### D.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

**Bugs fixed:**

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug #3920)

- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug #3873)
- Using a `MySQLDataSource` without server name fails. (Bug #3848)

#### D.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

##### Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for \*BLOBs \*TEXT correctly, so the driver won't return those correctly. (Bug #3570)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug #3557)
- Not specifying database in URL caused `MalformedURLException` exception. (Bug #3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug #3554)
- Use `junit.textui.TestRunner` for all unit tests (to enable them to be run from the command line outside of Ant or Eclipse). (Bug #3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug #3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug #3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug #3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug #3520)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug #3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug #3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug #2957)
- Use `SET character_set_results` during initialization to enable any charset to be returned to the driver for result sets. (Bug #2670)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and `setBinary/CharacterStream()`. (Bug #2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug #2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers  $\geq 4.1.2$ . (Bug #2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL  $\geq 4.1.0$ . (Bug #2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to permit end users to see what charset the driver thinks it should be using for the column. (Bug #2670)
- Only set `character_set_results` for MySQL  $\geq 4.1.0$ . (Bug #2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to enable the user to configure the state of the connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a

`Timestamp` to maintain full precision. (Bug #103)

- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to enable clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

#### D.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

##### Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug #2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug #2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug #2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug #2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>) (Bug #2578)
- Fixed failover always going to last host in list. (Bug #2578)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. (Bug #2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug #2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` using the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

#### D.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

##### Bugs fixed:

- Enable caching of the parsing stage of prepared statements using the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug #2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug #2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug #2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug #2006)
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`. (Bug #2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug #2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug #2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug #2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug #2006)
- Use constants for `SQLStates`. (Bug #2006)

- Map charset `kol8_ru` to `kol8r` when connected to MySQL-4.1.0 or newer. (Bug #2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug #2006)
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug #1958)
- Connection property `maxRows` not honored. (Bug #1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug #1925)
- Support escape sequence `{fn convert ... }`. (Bug #1914)
- Implement `ResultSet.updateClob()`. (Bug #1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug #1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug #1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug #1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. (Bug #1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug #1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug #1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug #1731)
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug #1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug #1630)
- Fix for 4.1.1-style authentication with no password. (Bug #1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug #1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug #1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug #1576)
- Barge blobs and split packets not being read correctly. (Bug #1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug #1534)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug #1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug #1511)

#### D.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

##### Bugs fixed:

- `ResultSet.get/setString` mashing char 127. (Bug #1247)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug #1247)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug #1247)

- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug #1247)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug #1246)
- Optimized `CLOB.setCharacterStream()`. (Bug #1131)
- Fixed `CLOB.truncate()`. (Bug #1130)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug #1099)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug #1099)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug #884)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug #884)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in nonescaped input. (Bug #879)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows to not monopolize CPU time. (Bug #879)
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). (Bug #848)
- Don't hide messages from exceptions thrown in I/O layers. (Bug #848)
- Fixed regression in large split-packet handling. (Bug #848)
- Better diagnostic error messages in exceptions for “streaming” result sets. (Bug #848)
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug #774)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug #688)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug #688)
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug #688)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug #688)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug #688)
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. (Bug #675)
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug #664, Bug #517)
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug #664, Bug #517)
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug #661)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug #496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug #496)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

#### D.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

**Bugs fixed:**

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug #378)
- Fix problem detecting server character set in some cases. (Bug #378)
- Allow multiple calls to `Statement.close()`. (Bug #378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug #378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. (Bug #378)
- Fix row data decoding error when using *very* large packets. (Bug #378)
- Optimized row data decoding. (Bug #378)
- Issue exception when operating on an already closed prepared statement. (Bug #378)
- Optimized usage of `EscapeProcessor`. (Bug #378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

#### D.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

**Bugs fixed:**

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)

- Don't reset `Connection.isReadOnly()` when `autoReconnecting`.
- Fixed escaping of `0x5c ('\\')` character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

#### D.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

**Bugs fixed:**

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return " " when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not permitted with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, `true`; otherwise, `no`).

#### D.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

**Bugs fixed:**

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`.

#### D.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

**Bugs fixed:**

- Streamlined character conversion and `byte[]` handling in `PreparedStatement` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatement` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to enable control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

#### D.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

**Bugs fixed:**

- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` using `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and permit nested escape sequences (see `test-suite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be nonstatic.
- Use nonaliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to permit it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).

- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

#### D.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

**Bugs fixed:**

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which enables you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See [README](#) for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also enables cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding using properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatement`s not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that enables users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.

- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

#### D.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

**Bugs fixed:**

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.

#### D.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

**Bugs fixed:**

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by

MySQL (SF bug 586058).

- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements using controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me [<mark@mysql.com>](mailto:mark@mysql.com).
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

## D.6.5. Changes in MySQL Connector/J 2.0.x

### D.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

#### Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, “” will be used as an identifier quote character, otherwise “'” will be used.

### D.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

#### Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).

- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

### D.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

#### Bugs fixed:

- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to `DBMD` (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

### D.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

#### Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

### D.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

#### Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

### D.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

#### Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

### D.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

#### Bugs fixed:

- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

### D.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

#### Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)

- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

#### D.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

**Bugs fixed:**

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

#### D.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

**Bugs fixed:**

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DatabaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

#### D.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

**Bugs fixed:**

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of `-/+INF` for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to enable (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

#### D.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

**Bugs fixed:**

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatement` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

#### D.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

#### D.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.
- Added `Short` as a type to `PreparedStatement.setObject()`. Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.

- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

#### **D.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)**

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

#### **D.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)**

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now permits null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859\_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859\_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotation marks.

#### **D.6.7. Changes in MySQL Connector/J 1.2.x and lower**

##### **D.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)**

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)

- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

#### **D.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)**

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

#### **D.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)**

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all \*text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

#### **D.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)**

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

#### **D.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)**

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values using setObject() (code from Robert Currey).

- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

#### **D.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)**

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

#### **D.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)**

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set using properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value using "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

#### **D.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)**

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LGPL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.toString() to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

#### D.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to `getTypeInfo()` for parameters, and so forth.
- `DatabaseMetaData` is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

#### D.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented `getTypeInfo()`. `Connection.rollback()` now throws an `SQLException` per the JDBC spec.
- Added `PreparedStatement` that supports all JDBC API methods for `PreparedStatement` including `InputStreams`. Please check this out and let me know if anything is broken.
- Fixed a bug in `ResultSet` that would break some queries that only returned 1 row.
- Fixed bugs in `DatabaseMetaData.getTables()`, `DatabaseMetaData.getColumns()` and `DatabaseMetaData.getCatalogs()`.
- Added functionality to `Statement` that enables `executeUpdate()` to store values for IDs that are automatically generated for `AUTO_INCREMENT` fields. Basically, after an `executeUpdate()`, look at the `SQLWarnings` for warnings like `"LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'"`. If you are using `AUTO_INCREMENT` fields in your tables and are executing a lot of `executeUpdate()`s on one `Statement`, be sure to `clearWarnings()` every so often to save memory.

#### D.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split `MysqlIO` and `Buffer` to separate classes. Some `ClassLoaders` gave an `IllegalAccessException` error for some fields in those two classes. Now `mm.mysql` works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

#### D.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed `DatabaseMetadata` problems in `getColumns()` and bug in switch statement in the `Field` constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

#### D.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`

- `getTableTypes()`
- `getColumns()`
- `getCatalogs()`

## D.7. MySQL Connector/MXJ Change History

### D.7.1. Changes in MySQL Connector/MXJ 5.0.11 (24th November 2009)

#### Functionality added or changed:

- The embedded MySQL binaries have been updated to MySQL 5.1.40 for GPL releases and MySQL 5.1.40 for Commercial releases.
- The contents of the directory used for bootstrapping the MySQL databases is now configurable by using the `windows-share-dir-jar` property. You should supply the name of a jar containing the files you want to use.
- The embedded Aspect/J class has been removed.
- The default timeout for the kill delay within the embedded test suite has been increased from 10 to 30 seconds.

#### Bugs fixed:

- On startup Connector/MXJ generated an exception on Windows 7:

```
Exception in thread "Thread-3" java.util.MissingResourceException: Resource
'5-0-51a/Windows_7-x86/mysqld-nt.exe' not found

at com.mysql.management.MysqldResource?.start(MysqldResource?. java:166)
```

The default `platform-map.properties` file, which maps platforms to the supplied binary bundles, has been updated with additional platforms, including Windows 7, Windows Server 2008, `amd64` and `sparcv9` for Solaris, and Mac OS X 64-bit. (Bug #48298)

### D.7.2. Changes in MySQL Connector/MXJ 5.0.10 (Never released)

This was an internal only release.

#### Functionality added or changed:

- The embedded MySQL has been updated to the MySQL 5.1 series. The embedded MySQL binaries have been updated to MySQL 5.1.33 for GPL releases and MySQL 5.1.34 for Commercial releases.
- The MySQL binary for Windows targets has been updated to be configurable through the `windows-mysqld-command` property. This is to handle the move in MySQL 5.1.33 from `mysqld-nt.exe` to `mysqld.exe`. The default value is `mysqld.exe`.

### D.7.3. Changes in MySQL Connector/MXJ 5.0.9 (19 August 2008)

#### Functionality added or changed:

- The port used in the `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` port is no longer hard coded. Instead, the code uses the `x-mxj_test_port` property a default value of `3336`
- The utility used to kill MySQL on Windows (`kill.exe`) has been configured to be loaded from the `kill.exe` property, instead of being hard-coded. The corresponding timeout, `KILL_DELAY` has also been moved to the properties file and defaults to 5 minutes.
- The embedded MySQL binaries have been updated to MySQL 5.0.51a for GPL releases and MySQL 5.0.54 for Commercial releases.
- The timeout for kill operations in the embedded test suite has been set to a default of 10 seconds.

## D.7.4. Changes in MySQL Connector/MXJ 5.0.8 (06 August 2007)

### Functionality added or changed:

- The embedded documentation has been updated so that it now points to the main MySQL documentation pages in the MySQL reference manual.
- The embedded MySQL binaries have been updated to MySQL 5.0.45 for GPL releases and MySQL 5.0.46 for Commercial releases.

## D.7.5. Changes in MySQL Connector/MXJ 5.0.7 (27 May 2007)

### Functionality added or changed:

- Updated the jar filename to be consistent with the Connector/J jar filename. Files are now formatted as `mysql-connector-or-mxj-mxj-version`.
- The `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` have been updated to include an example of initializing the user/password and creating an initial database. The `InitializePasswordExample` example class has now been removed.
- The `PatchedStandardSocketFactory` class has been removed, because it fixed an issue in Connector/J that was corrected in Connector/J 5.0.6.
- The embedded MySQL binaries have been updated to MySQL 5.0.41 for GPL releases and MySQL 5.0.42 for Commercial releases.

### Bugs fixed:

- Added a null-check to deal with class loaders where `getClassLoader()` returns null.

## D.7.6. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

### Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/

password and creating the initial database (rather than using "test").

- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

#### **Bugs fixed:**

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preperation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

## **D.7.7. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)**

#### **Bugs fixed:**

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.

- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml`: `usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes a bug where `mysqld` was being force terminated. Issue reported by bruno haleblan and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default `mysql` version to 5.0.37.
- In testing so far `mysqld` reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand to enable setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to `mysqld`.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out `gpl` binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

## D.7.8. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

### Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. (Bug #24004)
- Updated `build.xml` to build to handle with different `gpl` and commercial `mysqld` version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out `gpl` binaries for v5.0.27.

- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

## D.7.9. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

### Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

## D.7.10. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

### Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- `ServerLauncherSocketFactory.shutdown` API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- `MysqldResource` now tied to `dataDir` as well as `basedir` (API CHANGE)
- moved PID file into datadir

- `ServerLauncherSocketFactory.shutdown` now works across JVMs.
- extracted `splitLines(String)` to `Str` utility class
- `ServerLauncherSocketFactory.shutdown(port)` no longer throws, only reports to `System.err`
- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOption-Map.put("foo", null)`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (`basedir`, `datadir`)

## D.7.11. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

This section has no changelog entries.

## D.7.12. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

### Bugs fixed:

- Removed `HelpOptionsParser`'s need to reference a `MysqldResource`.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ (`"jdbc:mysql:mxj://"`)
- Swapped out the `mysqld` binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with `Str`).
- Minor refactorings for type casting and exception handling.

## D.8. MySQL Connector/C++ Change History

### D.8.1. Changes in MySQL Connector/C++ 1.1.x

#### D.8.1.1. Changes in MySQL Connector/CPP 1.1.0 (13th September 2010 GA)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

#### Functionality added or changed:

- **Incompatible Change:** API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses `boost::variant`. Code such as:

```
sql::ConnectPropertyVal tmp;
tmp.str.val=password.c_str();
tmp.str.len=password.length();
connection_properties["password"] = tmp;
```

Should be changed to:

```
connection_properties["password"] = sql::ConnectPropertyVal(password);
```

- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use `boost::scoped_array`. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.

- `LD_FLAGS`, `CXX_FLAGS` and `CPP_FLAGS` are now checked from the environment for every binary generated.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use `CMake` for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are available for `Connection::setClientOption()`.

**Bugs fixed:**

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. (Bug #45846)
- `CMake` generated an error if configuring an out of source build, that is, when `CMake` was not called from the source root directory. (Bug #45843)
- Using Prepared Statements caused corruption of the heap. (Bug #45048)
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. (Bug #44931)
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. (Bug #44931)
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.
- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.

## D.8.2. Changes in MySQL Connector/C++ 1.0.x

### D.8.2.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

**Functionality added or changed:**

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

```
connection->getMetaData->getSchema();
```

This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.

- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

**Bugs fixed:**

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

### D.8.2.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

**Functionality added or changed:**

- An installer was added for the Windows operating system.
- Minimum `CMake` version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which enables control of the `INFORMATION_SCHEMA` for metadata.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.
- Introduced `ResultSetMetaData::isZerofill()`, which is not in the JDBC specification.

**Bugs fixed:**

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

### D.8.2.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

**Functionality added or changed:**

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGNED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.

- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with bzip2.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typedefs for Windows to be able to use `int64_t`.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

**Bugs fixed:**

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.
- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

#### D.8.2.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

**Functionality added or changed:**

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

**Bugs fixed:**

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed a bug in `getString()`. `getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

### D.8.2.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

**Functionality added or changed:**

- `sql::mysql::MySQL_SQLErrorException` was removed. The distinction between server and client (connector) errors, based on

the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.

- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:

`mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

`mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

However, you can make your application fully abstract by using the generic interface rather than these two headers.

- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE=BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

```
examples/connect tcp://host:port user pass database
```

or

```
examples/connect unix:///path/to/mysql.sock user pass database
```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.
- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

## D.9. MySQL Proxy Change History

### D.9.1. Changes in MySQL Proxy 0.8.1 (13 September 2010)

#### Functionality added or changed:

- Allow interception of `LOAD DATA INFILE` and `SHOW ERRORS` statements.
- The unused `network_mysql_d_com_query_result_track_state()` function has been deprecated.
- `chassis_set_fdlimit()` has been deprecated in favor of `chassis_fdlimit_set()`.
- Shutdown hooks were added to free the global memory of third-party libraries such as `openssl`.
- `con->in_load_data_local` has been removed.

#### Bugs fixed:

- The admin plugin had an undocumented default value for `--admin-password`. (Bug #53429)
- Use of `LOAD DATA LOCAL INFILE` caused the connection between the client and MySQL Proxy to abort. (Bug #51864)
- If the backend MySQL server went down, and then the clock on the MySQL Proxy host went backward (for example, during day-light saving time adjustments), Proxy stopped forwarding queries to the backend. (Bug #50806)
- `network_address_set_address()` -> `network_address_set_address_ip()` called `gethostbyname()` which was not reentrant. This meant that a MySQL Proxy plugin needed to guard all calls to `network_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. (Bug #49099)
- The hard limit was fixed for the case where the fdlimit was set. (Bug #48120)
- MySQL Proxy returned an error message with a nonstandard SQL State when all backends were down:

```
"#07000(proxy) all backends are down"
```

This caused issues for clients with “retry” logic, as they could not handle these “custom” SQL States. (Bug #45417)

- If MySQL Proxy used a UNIX socket, it did not remove the socket file at termination time. (Bug #38415)
- The `--proxy-read-only-backend-addresses` option did not work. (Bug #38341, Bug #11749171)
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have been updated.

### D.9.2. Changes in MySQL Proxy 0.8.0 (21 January 2010)

#### Functionality added or changed:

- The `--no-daemon` has been renamed to The `--daemon`. By default, MySQL Proxy now starts in foreground mode. Use the `--no-daemon` option to override this and start in daemon mode.

#### Bugs fixed:

- A memory leak occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug #50993)
- A segmentation fault occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug #48641)
- MySQL Proxy would load a configuration file with unsafe permissions, which could permit password information to be exposed

through the file. MySQL Proxy now refuses to load a configuration file with unsafe permissions. (Bug #47589)

- Several supplied scripts were updated to account for flag and structure changes:
  - `active-transactions.lua` was updated to use the `resultset_is_needed` flag.
  - `ro-balance.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connection.dst.name` structure.
  - `rw-splitting.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connections` structure.

(Bug #47349, Bug #45408, Bug #47345, Bug #43424, Bug #42841, Bug #46141)

- The line numbers provided in stack traces were off by one. (Bug #47348)
- MySQL Proxy accepted more than one address in the value of the `--proxy-backend-addresses` option. You should specify one `--proxy-backend-addresses` option for each backend address. (Bug #47273)
- MySQL Proxy returned the wrong version string internally from the `proxy.PROXY_VERSION` constant. (Bug #45996)
- MySQL Proxy could stop accepting network packets if it received a large number of packets. The listen queue has been extended to permit a larger backlog. (Bug #45878, Bug #43278)
- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug #45272)
- MySQL Proxy failed to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. Now Proxy denies `COM_CHANGE_USER` commands when it is connected to MySQL 5.1.14 to 5.1.17 servers by sending back an error: `COM_CHANGE_USER is broken on 5.1.14-.17, please upgrade the MySQL Server`. (Bug #45167)

See also Bug #25371.

- Logging to `syslog` with the `--log-use-syslog` option did not work. (Bug #36431)
- MySQL Proxy could incorrectly insert `NULL` values into the returned result set, even though non-`NULL` values were returned in the original query. (Bug #35729)
- MySQL Proxy raised an error when processing query packets larger than 16MB. (Bug #35202)

### D.9.3. Changes in MySQL Proxy 0.7.2 (30 June 2009)

#### Bugs fixed:

- On Windows, MySQL Proxy might not find the required modules during initialization. The core code has been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. (Bug #45833)

### D.9.4. Changes in MySQL Proxy 0.7.1 (15 May 2009)

#### Bugs fixed:

- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug #45272)
- The port number was reported incorrectly in `proxy.connection.client.address`. (Bug #43313)
- Result sets with more than 250 fields could cause MySQL Proxy to crash. (Bug #43078)
- MySQL Proxy was unable to increase its own maximum number of open files according to the limit specified by the `--max-open-files` option, if the limit was less than 8192. When set to debug level, Proxy now reports the open files limit and

when the limit has been updated. (Bug #42783)

- MySQL Proxy crashed when connecting to a MySQL 4.0 server. Now it generates an error message instead. (Bug #38601)
- When using the `rw-splitting.lua` script, you could get an error when talking to the backend server:

```
2008-07-28 18:00:30: (critical) (read_query) [string
"/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
expected, got userdata)
```

This led to Proxy closing the connection to the configured MySQL backend. (Bug #38419)

- When using MySQL Proxy with multiple backends, failure of one backend caused Proxy to disconnect all backends and stop routing requests. (Bug #34793)

## D.9.5. Changes in MySQL Proxy 0.7.0 (Not Released)

### Functionality added or changed:

- Support for using a configuration file, in addition to the command-line options, has been added. To specify such a file, use the `--defaults-file=file_name` command-line option. See [Section 14.7.3, “MySQL Proxy Command Options”](#). (Bug #30206)
- A number of the internal structures developed for use with Lua scripts that work with MySQL Proxy have been updated and harmonized to make their meaning and contents easier to use and consistent across multiple locations.
  - The address information has been updated. Instead of a combined `ip:port` structure that you had to parse to extract the individual information, you can now access that information directly. For example, instead of structures providing a single `.address` item, you now have these items: `name` (the combined `ip:port`), `address` (the IP address), and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of connections.

Some familiar structures have been updated to accommodate this information:

- `proxy.connection.client.address` is `proxy.connection.client.src.name`
- `proxy.connection.server.address` is `proxy.connection.server.dst.name`
- `proxy.backends` is now in `proxy.global.backends`. The `.address` field of each backend is an address-object as described earlier. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
- The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

In `read_handshake()`, you access the information through the global `proxy.connection` table:

0.6	0.7
<code>auth.thread_id</code>	<code>proxy.connection.server.thread_id</code>
<code>auth.mysql_d_version</code>	<code>proxy.connection.server.mysql_d_version</code>
<code>auth.server_addr</code>	<code>proxy.connection.server.dst.name</code>
<code>auth.client_addr</code>	<code>proxy.connection.client.src.name</code>
<code>auth.scramble</code>	<code>proxy.connection.server.scramble_buffer</code>

In `read_auth()`, you can use the following:

0.6	0.7
<code>auth.username</code>	<code>proxy.connection.client.username</code>
<code>auth.password</code>	<code>proxy.connection.client.scrambled_password</code>
<code>auth.default_db</code>	<code>proxy.connection.client.default_db</code>

0.6	0.7
<code>auth.server_addr</code>	<code>proxy.connection.server.dst.name</code>
<code>auth.client_addr</code>	<code>proxy.connection.client.src.name</code>

- In the `proxy.queries:append()` function, a third parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the result set in the `read_query_result()` hook, you must set the `result-set_is_needed` flag:

```
proxy.queries:append( 1, ..., { resultset_is_needed = true } )
```

For more information, see [proxy.queries](#) [1438].

- `proxy.backends` is now in `proxy.global.backends`.

#### Bugs fixed:

- **Security Enhancement:** Accessing MySQL Proxy using a client or backend from earlier than MySQL 4.1 resulted in Proxy aborting with an assertion. This is because Proxy supports only MySQL 4.1 or higher. Proxy now reports a fault. (Bug #31419)
- MySQL Proxy was configured with the `LUA_PATH` and `LUA_CPATH` directory locations according to the build host rather than the execution host. In addition, during installation, certain Lua source files could be installed into the incorrect locations. (Bug #44877, Bug #44497)
- Using MySQL Proxy with very large return data sets from queries could cause a crash, with or without manipulation of the data set within the Lua engine. (Bug #39332)
- MySQL Proxy terminated if a submitted packet was smaller than expected by the protocol. (Bug #36743)
- When using MySQL Proxy in a master-master replication scenario, Proxy failed to identify failure in one of the replication masters and did not redirect connections to the other master. (Bug #35295)

## D.9.6. Changes in MySQL Proxy 0.6.1 (06 February 2008)

#### Functionality added or changed:

- Fixed assertions on write errors.
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

## D.9.7. Changes in MySQL Proxy 0.6.0 (11 September 2007)

#### Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. (Bug #30867)
- Added support in `read_query_result()` to overwrite the result set.
- By default, MySQL Proxy now starts in daemon mode. Use the new `--no-daemon` option to override this. Added the `--pid-file` option for writing the process ID to a file after becoming a daemon.

- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added test cases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global Lua-scope `proxy.global.*`.
- Added connection pooling.

**Bugs fixed:**

- Fixed an assertion on `COM_BINLOG_DUMP`. (Bug #29764)
- Fixed an assertion on result-packets like `[field-len | fields | EOF | ERR]`. (Bug #29732)
- Fixed an assertion that MySQL Proxy raised at login time if a client specified no password and no default database. (Bug #29719)
- Fixed an assertion at `COM_SHUTDOWN`. (Bug #29719)
- Fixed a crash if `proxy.connection` is used in `connect_server()`.
- Fixed the `glib2` check to require at least `glib2 2.6.0`.
- Fixed an assertion at connect time when all backends are down.
- Fixed connection stalling if `read_query_result()` raised an assertion.
- Fixed length encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed an assertion when connecting to MySQL 6.0.1.
- Fixed decoding of length-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result sets.
- Fixed a memory leak when `proxy.response.*` is used.

## D.9.8. Changes in MySQL Proxy 0.5.1 (30 June 2007)

**Functionality added or changed:**

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the Lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.

- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate result sets from a script.

**Bugs fixed:**

- Fixed mysql check in `configure` to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed a compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed a crash on fields longer than 250 bytes when the result set is inspected.
- Fixed a warning if `connect_server()` is not provided.
- Fixed an assertion when an error occurs at initial script exec time.
- Fixed an assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

## D.9.9. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

**Bugs fixed:**

- Added `automake/autoconf` support.
- Added `CMake` support.

---

## Appendix E. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

### E.1. Restrictions on Stored Routines, Triggers, and Events

These restrictions apply to the features described in [Chapter 17, \*Stored Programs and Views\*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

#### SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.6, “SQL Syntax for Prepared Statements”](#), for a list of statements supported as prepared statements. Only the statements listed there are supported for stored routines, unless noted otherwise in [Section 17.2, “Using Stored Routines \(Procedures and Functions\)”](#).
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted, but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

#### Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 12.7.3.3, “SELECT ... INTO Statement”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table:`

`tbl_name` error occurs, even if the references occur in different statements within the function.

- `HANDLER ... READ` statements that invoke stored functions can cause replication errors. As of MySQL 5.5.7, such statements are disallowed.

## Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see [Section 15.4.1.30, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

## Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

## Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 17.7, “Binary Logging of Stored Programs”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

## Debugging Considerations

There are no stored routine debugging facilities.

## Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- [UNDO](#) handlers are not supported.
- [FOR](#) loops are not supported.

## Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 17.7, “Binary Logging of Stored Programs”](#).

## Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names [anEvent](#) and [AnEvent](#).
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug#16409, Bug#18896)
- As of MySQL 5.5.8, DDL statements on events are prohibited while a [LOCK TABLES](#) statement is in effect.
- Event timings using the intervals [YEAR](#), [QUARTER](#), [MONTH](#), and [YEAR\\_MONTH](#) are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the [INFORMATION\\_SCHEMA.EVENTS](#) table's [LAST\\_EXECUTED](#) column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug#16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as [Com\\_select](#) and [Com\\_insert](#) that are displayed by [SHOW STATUS](#). However, such counts *are* updated in the global scope. (Bug#16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug#16396)
- References to stored functions, user-defined functions, and tables in the [ON SCHEDULE](#) clauses of [CREATE EVENT](#) and [ALTER EVENT](#) statements are not supported. These sorts of references are not permitted. (See Bug#22830 for more information.)
- Generally speaking, statements that are not permitted in stored routines or in SQL prepared statements are also not permitted in the body of an event. For more information, see [Section 12.6, “SQL Syntax for Prepared Statements”](#).

## E.2. Restrictions on Signals

[SIGNAL](#) and [RESIGNAL](#) are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

`SQLSTATE` values in class '04' are not treated specially. They are handled the same as other exceptions.

## E.3. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

## E.4. Restrictions on Subqueries

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return  $M$  and  $N$  rows, respectively, the execution time becomes on the order of  $O(M \times N)$ , rather than  $O(M+N)$  as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the **FROM** clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the result from the subquery in the **FROM** clause is stored as a temporary table, so the relevant rows in **t** have already been selected by the time the update to **t** takes place.

- Row comparison operations are only partially supported:
  - For **expr IN (subquery)**, **expr** can be an *n*-tuple (specified using row constructor syntax) and the subquery can return rows of *n*-tuples.
  - For **expr op {ALL|ANY|SOME} (subquery)**, **expr** must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for **IN** but not for the others is that **IN** is implemented by rewriting it as a sequence of = comparisons and **AND** operations. This approach cannot be used for **ALL**, **ANY**, or **SOME**.

- Subqueries in the **FROM** clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- MySQL does not support **LIMIT** in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
-> WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
'LIMIT & IN/ALL/ANY/SOME subquery'
```

- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an **IN** subquery can be rewritten as a **SELECT DISTINCT** join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra **DISTINCT** operation and is not more efficient than the subquery.

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if **f()** inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is nonstandard (not permitted by the SQL standard). In MySQL, it can produce indeterminate results because **f()** might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be

executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on (`ot.a, ot.b`).

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join enables the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

## E.5. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.

- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section E.4, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the `EXECUTE` statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug#22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

## E.6. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA,” storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

## E.7. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2`, `utf16`, and `utf32` character sets have the following restrictions:
  - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See [Section 9.1.4](#), “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.

- The use of `ENCRYPT()` with these character sets is not recommended because the underlying system call expects a string terminated by a zero byte.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

## E.8. Performance Schema Restrictions

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `SETUP_XXX` tables.

Tables in the `performance_schema` database cannot be indexed.

Results for queries that refer to tables in the `performance_schema` database are not saved in the query cache.

Tables in the `performance_schema` database are not replicated.

The Performance Schema is not available in `libmysqld`, the embedded server.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

## E.9. Limits in MySQL

This section lists current limits in MySQL 5.5.

### E.9.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

### E.9.2. Limits on Number of Databases and Tables

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of directories.

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of tables. Individual storage engines may impose engine-specific constraints. `InnoDB` permits up to 4 billion tables.

### E.9.3. Limits on Table Size

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)

Operating System	File-size Limit
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at [http://www.suse.de/~aj/linux\\_lfs.html](http://www.suse.de/~aj/linux_lfs.html).

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The disk might be full.
- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This enables a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which permits extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.3.6, “Adding, Removing, or Resizing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is permitted by the internal pointer size. [MyISAM](#) permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB ( $256^7 - 1$  bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG\\_ROW\\_LENGTH](#) and [MAX\\_ROWS](#) options. See [Section 12.1.14, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum permissible size. See [Section 12.1.6, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG\\_ROW\\_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam\\_data\\_pointer\\_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX\\_ROWS](#) option. The value of [myisam\\_data\\_pointer\\_size](#) can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [myisamchk -dv /path/to/table-index-file](#). See [Section 12.4.5, “SHOW Syntax”](#), or [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [myisampack](#) to compress it. [myisampack](#) usually compresses a table by at least

50%, so you can have, in effect, much bigger tables. `myisampack` also can merge multiple tables into a single table. See [Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).

- MySQL includes a `MERGE` library that enables you to handle a collection of `MyISAM` tables that have identical structure as a single `MERGE` table. See [Section 13.10, “The MERGE Storage Engine”](#).
- You are using the `MEMORY (HEAP)` storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See [Section 5.1.3, “Server System Variables”](#).

## E.9.4. Table Column-Count and Row-Size Limits

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors.

- Every table (regardless of storage engine) has a maximum row size of 65,535 bytes. Storage engines may place additional constraints on this limit, reducing the effective maximum row size.

The maximum row size constrains the number (and possibly size) of columns because the total length of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate  $255 \times 3 = 765$  bytes per value. Consequently, a table cannot contain more than  $65,535 / 765 = 85$  such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately from the rest of the row.

Declaring columns `NULL` can reduce the maximum number of columns permitted. For `MyISAM` tables, `NULL` columns require additional space in the row to record whether their values are `NULL`. Each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header. For information about `MyISAM` table formats, see [Section 13.5.3, “MyISAM Table Storage Formats”](#).

These calculations do not apply for `InnoDB` tables. Storage size is the same for `NULL` and `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL)
-> ENGINE = MyISAM CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and `MyISAM` requires additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL)
-> ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

The following statement to create table `t3` fails because although the column length is within the maximum length of 65,535 bytes, two additional bytes are required to record the length, which causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t3
-> (c1 VARCHAR(65535) NOT NULL)
-> ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

Reducing the column length to 65,533 or less permits the statement to succeed.

- Each table has an `.frm` file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the `.frm` file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- `info_length` is space needed for “screens.” This is related to MySQL’s Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for `ENUM` and `SET` columns.
- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column, index, or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
  - `InnoDB` permits no more than 1000 columns.
  - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
  - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

## E.9.5. Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in

the default data directory configured with the `datadir` option.

- **Limited number of ports**

Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

For more information about this problem, see <http://support.microsoft.com/default.aspx?scid=kb;en-us;196271>.

- **DATA DIRECTORY and INDEX DIRECTORY**

The `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows, because MySQL does not support Windows symbolic links. These options also are ignored on systems that have a nonfunctional `realpath()` call.

- **DROP DATABASE**

You cannot drop a database that is in use by another session.

- **Case-insensitive names**

File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See [Section 8.2.2, “Identifier Case Sensitivity”](#).

- **Directory and file names**

On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
datadir="C:/私たちのプロジェクトのデータ"
```

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The “\” path name separator character**

Path name components in Windows are separated by the “\” character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with “/” characters:

```
mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;  
mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
```

Alternatively, you must double the “\” character:

```
mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;  
mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
```

- **Problems with pipes**

Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z / CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

This is mainly a problem when you try to apply a binary log as follows:

```
C:\> mysqlbinlog binary_log_file | mysql --user=root
```

If you have a problem applying the log and suspect that it is because of a `^Z / CHAR(24)` character, you can use the following workaround:

```
C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql  
C:\> mysql --user=root --execute "source /tmp/bin.sql"
```

The latter command also can be used to reliably read in any SQL file that may contain binary data.

mysqld, [Section 5.1.2, “Server Command Options”](#)

debug\_sync system variable, [Section 5.1.3, “Server System Variables”](#)

## debugging

client, [Section 21.5.2, “Debugging a MySQL Client”](#)

server, [Section 21.5.1, “Debugging a MySQL Server”](#)

debugging support, [Section 2.9.4, “MySQL Source-Configuration Options”](#)

decimal arithmetic, [Section 11.18, “Precision Math”](#)

decimal point, [Chapter 10, \*Data Types\*](#)

decode\_bits myisamchk variable, [Section 4.6.3.1, “myisamchk General Options”](#)

default host name, [Section 4.2.2, “Connecting to the MySQL Server”](#)

default installation location, [Section 2.1.5, “Installation Layouts”](#)

default options, [Section 4.2.3.3, “Using Option Files”](#)

default values, [Section 12.1.14, “CREATE TABLE Syntax”](#), [Section 12.2.5, “INSERT Syntax”](#), [Section 10.1.4, “Data Type Default Values”](#)

BLOB and TEXT columns, [Section 10.4.3, “The BLOB and TEXT Types”](#)

explicit, [Section 10.1.4, “Data Type Default Values”](#)

implicit, [Section 10.1.4, “Data Type Default Values”](#)

suppression, [Section 1.8.6.2, “Constraints on Invalid Data”](#)

## default-auth option

mysql, [Section 4.5.1.1, “mysql Options”](#)

mysql\_upgrade, [Description](#)

mysqladmin, [Description](#)

mysqlbinlog, [Description](#)

mysqlcheck, [Description](#)

mysqldump, [Description](#)

mysqlimport, [Description](#)

mysqlshow, [Description](#)

mysqlslap, [Description](#)

## default-character-set option

mysql, [Section 4.5.1.1, “mysql Options”](#)

mysqladmin, [Description](#)

mysqlcheck, [Description](#)

mysqld, [Section 5.1.2, “Server Command Options”](#)

mysqldump, [Description](#)

mysqlimport, [Description](#)

mysqlshow, [Description](#)

## default-collation option

mysqld, [Section 5.1.2, “Server Command Options”](#)

## default-storage-engine option

mysqld, [Section 5.1.2, “Server Command Options”](#)

## default-table-type option

mysqld, [Section 5.1.2, “Server Command Options”](#)

## default-time-zone option

mysqld, [Section 5.1.2, “Server Command Options”](#)

default\_storage\_engine system variable, [Section 5.1.3, “Server System Variables”](#)

default\_week\_format system variable, [Section 5.1.3, “Server System Variables”](#)

## defaults

embedded, [Section 20.8.3, “Options with the Embedded Server”](#)

defaults-extra-file option, [Section 4.2.3.3.1, “Command-Line Options that Affect Option-File Handling”](#)

my\_print\_defaults, [Description](#)

mysqld\_multi, [Description](#)

mysqld\_safe, [Description](#)

defaults-file option, [Section 4.2.3.3.1, “Command-Line Options that Affect Option-File Handling”](#)

my\_print\_defaults, [Description](#)

mysqld\_multi, [Description](#)

mysqld\_safe, [Description](#)

defaults-group-suffix option, [Section 4.2.3.3.1, “Command-Line Options that Affect Option-File Handling”](#)

my\_print\_defaults, [Description](#)

Table”

## S

SAVEPOINT, Section 12.3.4, “SAVEPOINT and ROLLBACK TO SAVEPOINT Syntax”

SCHEMA(), Section 11.14, “Information Functions”

SCHEMATA

INFORMATION\_SCHEMA table, Section 18.1, “The INFORMATION\_SCHEMA SCHEMATA Table”

SCHEMA\_PRIVILEGES

INFORMATION\_SCHEMA table, Section 18.6, “The INFORMATION\_SCHEMA SCHEMA\_PRIVILEGES Table”

SECOND(), Section 11.7, “Date and Time Functions”

SEC\_TO\_TIME(), Section 11.7, “Date and Time Functions”

SELECT

LIMIT, Section 12.2.9, “SELECT Syntax”

Query Cache, Section 7.9.3, “The MySQL Query Cache”

optimizing, Section 7.8.1, “Optimizing Queries with EXPLAIN”, Section 12.8.2, “EXPLAIN Syntax”

SELECT INTO, Section 12.7.3.3, “SELECT . . . INTO Statement”

SELECT INTO TABLE, Section 1.8.5.1, “SELECT INTO TABLE Differences”

SELECT speed, Section 7.2.1.1, “Speed of SELECT Statements”

SEQUENCE, Section 3.6.9, “Using AUTO\_INCREMENT”

SERIAL, Section 10.1.1, “Overview of Numeric Types”

SERIAL DEFAULT VALUE, Section 10.1.4, “Data Type Default Values”

SERIALIZABLE

transaction isolation level, Section 12.3.6, “SET TRANSACTION Syntax”

SESSION\_STATUS

INFORMATION\_SCHEMA table, Section 18.25, “The INFORMATION\_SCHEMA GLOBAL\_STATUS and SESSION\_STATUS Tables”

SESSION\_USER(), Section 11.14, “Information Functions”

SESSION\_VARIABLES

INFORMATION\_SCHEMA table, Section 18.26, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

SET, Section 12.7.3.2, “Variable SET Statement”, Section 12.4.4, “SET Syntax”

CHARACTER SET, Section 9.1.4, “Connection Character Sets and Collations”, Section 12.4.4, “SET Syntax”

NAMES, Section 9.1.4, “Connection Character Sets and Collations”, Section 9.1.5, “Configuring the Character Set and Collation for Applications”, Section 12.4.4, “SET Syntax”

ONE\_SHOT, Section 12.4.4, “SET Syntax”

size, Section 10.5, “Data Type Storage Requirements”

SET GLOBAL sql\_slave\_skip\_counter, Section 12.5.2.4, “SET GLOBAL sql\_slave\_skip\_counter Syntax”

SET OPTION, Section 12.4.4, “SET Syntax”

SET PASSWORD, Section 12.4.1.6, “SET PASSWORD Syntax”

SET PASSWORD statement, Section 5.5.5, “Assigning Account Passwords”

SET TRANSACTION, Section 12.3.6, “SET TRANSACTION Syntax”

SET data type, Section 10.1.3, “Overview of String Types”, Section 10.4.5, “The SET Type”

SET sql\_log\_bin, Section 12.5.1.3, “SET sql\_log\_bin Syntax”

SET statement

assignment operator, Section 11.3.4, “Assignment Operators”

SHA(), Section 11.13, “Encryption and Compression Functions”

SHA1(), Section 11.13, “Encryption and Compression Functions”

SHA2(), Section 11.13, “Encryption and Compression Functions”

SHOW AUTHORS, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.1,

“SHOW AUTHORS Syntax”

SHOW BINARY LOGS, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.2, “SHOW BINARY LOGS Syntax”

SHOW BINLOG EVENTS, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.3, “SHOW BINLOG EVENTS Syntax”

SHOW CHARACTER SET, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.4, “SHOW CHARACTER SET Syntax”

SHOW COLLATION, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.5, “SHOW COLLATION Syntax”

SHOW COLUMNS, Section 12.4.5.6, “SHOW COLUMNS Syntax”, Section 12.4.5, “SHOW Syntax”

SHOW CONTRIBUTORS, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.7, “SHOW CONTRIBUTORS Syntax”

SHOW CREATE DATABASE, Section 12.4.5.8, “SHOW CREATE DATABASE Syntax”, Section 12.4.5, “SHOW Syntax”

SHOW CREATE EVENT, Section 12.4.5, “SHOW Syntax”

SHOW CREATE FUNCTION, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.10, “SHOW CREATE FUNCTION Syntax”

SHOW CREATE PROCEDURE, Section 12.4.5, “SHOW Syntax”, Section 12.4.5.11, “SHOW CREATE PROCEDURE Syntax”

SHOW CREATE SCHEMA, Section 12.4.5.8, “SHOW CREATE DATABASE Syntax”, Section 12.4.5, “SHOW Syntax”

## tab option

`mysqldump`, [Description](#)

## table

changing, [Section C.5.7.1, “Problems with `ALTER TABLE`”](#), [Section 12.1.6, “`ALTER TABLE` Syntax”](#)

deleting, [Section 12.1.23, “`DROP TABLE` Syntax”](#)

row size, [Section 10.5, “Data Type Storage Requirements”](#)

table aliases, [Section 12.2.9, “`SELECT` Syntax”](#)

table cache, [Section 7.4.3.1, “How MySQL Opens and Closes Tables”](#)

## table description

`myisamchk`, [Section 4.6.3.5, “Obtaining Table Information with `myisamchk`”](#)

table is full, [Section 5.1.3, “Server System Variables”](#), [Section C.5.2.12, “`The table is full`”](#)

## table names

case sensitivity, [Section 8.2.2, “Identifier Case Sensitivity”](#)

case-sensitivity, [Section 1.8.4, “MySQL Extensions to Standard SQL”](#)

## table option

`mysql`, [Section 4.5.1.1, “`mysql` Options”](#)

`mysqlaccess`, [Description](#)

## table scans

avoiding, [Section 7.2.1.4, “How to Avoid Table Scans”](#)

## table types

choosing, [Chapter 13, \*Storage Engines\*](#)

table-level locking, [Section 7.10.1, “Internal Locking Methods”](#)

`table_cache`, [Section 7.4.3.1, “How MySQL Opens and Closes Tables”](#)

`table_cache` system variable, [Section 5.1.3, “Server System Variables”](#)

`table_definition_cache` system variable, [Section 5.1.3, “Server System Variables”](#)

`table_lock_wait_timeout` system variable, [Section 5.1.3, “Server System Variables”](#)

`table_open_cache`, [Section 7.4.3.1, “How MySQL Opens and Closes Tables”](#)

`table_open_cache` system variable, [Section 5.1.3, “Server System Variables”](#)

`table_type` system variable, [Section 5.1.3, “Server System Variables”](#)

## tables

BLACKHOLE, [Section 13.9, “The `BLACKHOLE` Storage Engine”](#)

CSV, [Section 13.7, “The `CSV` Storage Engine”](#)

EXAMPLE, [Section 13.12, “The `EXAMPLE` Storage Engine”](#)

FEDERATED, [Section 13.11, “The `FEDERATED` Storage Engine”](#)

HEAP, [Section 13.6, “The `MEMORY` Storage Engine”](#)

InnoDB, [Section 13.3, “The `InnoDB` Storage Engine”](#)

MEMORY, [Section 13.6, “The `MEMORY` Storage Engine”](#)

MERGE, [Section 13.10, “The `MERGE` Storage Engine”](#)

MyISAM, [Section 13.5, “The `MyISAM` Storage Engine”](#)

checking, [Section 4.6.3.2, “`myisamchk` Check Options”](#)

closing, [Section 7.4.3.1, “How MySQL Opens and Closes Tables”](#)

compressed, [Section 4.6.5, “`myisampack` — Generate Compressed, Read-Only MyISAM Tables”](#)

compressed format, [Section 13.5.3.3, “Compressed Table Characteristics”](#)

`const`, [Section 7.8.2, “`EXPLAIN` Output Format”](#)

constant, [Section 7.2.1.2, “How MySQL Optimizes `WHERE` Clauses”](#)

copying, [Section 12.1.14, “`CREATE TABLE` Syntax”](#), [Section 12.1.14.1, “`CREATE TABLE ... SELECT` Syntax”](#)

counting rows, [Section 3.3.4.8, “Counting Rows”](#)

creating, [Section 3.3.2, “Creating a Table”](#)

defragment, [Section 13.5.3.2, “Dynamic Table Characteristics”](#)

defragmenting, [Section 12.4.2.4, “`OPTIMIZE TABLE` Syntax”](#), [Section 6.6.5, “Setting Up a MyISAM Table Maintenance Schedule”](#)

deleting rows, [Section C.5.5.6, “Deleting Rows from Related Tables”](#)

displaying, [Section 4.5.6, “`mysqlshow` — Display Database, Table, and Column Information”](#)

displaying status, [Section 12.4.5.37, “`SHOW TABLE STATUS` Syntax”](#)

dumping, [Section 4.5.4, “`mysqldump` — A Database Backup Program”](#), [Section 4.6.9, “`mysqlhotcopy` — A Database Backup Program”](#)

dynamic, [Section 13.5.3.2, “Dynamic Table Characteristics”](#)

error checking, [Section 6.6.2, “How to Check MyISAM Tables for Errors”](#)

flush, [Description](#)

fragmentation, [Section 12.4.2.4, “`OPTIMIZE TABLE` Syntax”](#)

host, [Section 5.4.5, “Access Control, Stage 2: Request Verification”](#)

improving performance, [Section 7.4.1, “Optimizing Data Size”](#)

# Function Index

## `my_init()`

Section 20.9.8.1, “`my_init()`”  
Section 20.9.8.3, “`mysql_thread_init()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_affected_rows()`

Section 12.2.1, “CALL Syntax”  
Section 12.2.5, “INSERT Syntax”  
Section 12.2.8, “REPLACE Syntax”  
Section 20.9.3.1, “`mysql_affected_rows()`”  
Section 20.9.3.46, “`mysql_next_result()`”  
Section 20.9.3.48, “`mysql_num_rows()`”  
Section 20.9.7.1, “`mysql_stmt_affected_rows()`”  
Section 20.9.3.71, “`mysql_use_result()`”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”  
Section 11.14, “Information Functions”  
Section 20.9.11.2, “What Results You Can Get from a Query”

## `mysql_autocommit()`

Section 20.9.3.2, “`mysql_autocommit()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_change_user()`

Section 20.9.3.3, “`mysql_change_user()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_character_set_name()`

Section 20.9.3.4, “`mysql_character_set_name()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_client_find_plugin()`

Section 20.9.10.1, “`mysql_client_find_plugin()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_client_register_plugin()`

Section 20.9.10.2, “`mysql_client_register_plugin()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_close()`

Section 20.9.3.5, “`mysql_close()`”  
Section 20.9.3.6, “`mysql_commit()`”  
Section 20.9.3.7, “`mysql_connect()`”  
Section 20.9.3.36, “`mysql_init()`”  
Section 20.9.3.57, “`mysql_rollback()`”  
Section 20.9.2, “C API Function Overview”  
Section C.5.2.11, “Communication Errors and Aborted Connections”

## `mysql_commit()`

Section 20.9.3.6, “`mysql_commit()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_connect()`

Section 20.9.8.1, “`my_init()`”  
Section 20.9.3.5, “`mysql_close()`”

Section 20.9.3.7, “`mysql_connect()`”  
Section 20.9.3.49, “`mysql_options()`”  
Section 20.9.8.3, “`mysql_thread_init()`”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.17.2, “How to Write a Threaded Client”

## `mysql_create_db()`

Section 20.9.3.8, “`mysql_create_db()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_data_seek()`

Section 20.9.3.9, “`mysql_data_seek()`”  
Section 20.9.3.58, “`mysql_row_seek()`”  
Section 20.9.3.71, “`mysql_use_result()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_debug()`

Section 20.9.3.10, “`mysql_debug()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_drop_db()`

Section 20.9.3.11, “`mysql_drop_db()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_dump_debug_info()`

Section 20.9.3.12, “`mysql_dump_debug_info()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_eof()`

Section 20.9.3.13, “`mysql_eof()`”  
Section 20.9.2, “C API Function Overview”

## `mysql_errno(&mysql)`

Section 20.9.3.22, “`mysql_field_count()`”  
Section 20.9.3.47, “`mysql_num_fields()`”

## `mysql_errno()`

Section 20.9.10.1, “`mysql_client_find_plugin()`”  
Section 20.9.10.2, “`mysql_client_register_plugin()`”  
Section 20.9.3.7, “`mysql_connect()`”  
Section 20.9.3.13, “`mysql_eof()`”  
Section 20.9.3.14, “`mysql_errno()`”  
Section 20.9.10.3, “`mysql_load_plugin()`”  
Section 20.9.3.66, “`mysql_sqlstate()`”  
Section 20.9.3.69, “`mysql_store_result()`”  
Section 20.9.3.71, “`mysql_use_result()`”  
Section 20.9.3, “C API Function Descriptions”  
Section 20.9.2, “C API Function Overview”  
Section 12.7.8.1.1, “Signal Condition Information Items”  
Section C.2, “Types of Error Values”  
Section 20.9.11.1, “Why `mysql_store_result()` Sometimes Returns NULL After `mysql_query()` Returns Success”  
Section 21.2.4.7, “Writing Audit Plugins”

## `mysql_error()`

Section 20.9.10.1, “`mysql_client_find_plugin()`”  
Section 20.9.10.2, “`mysql_client_register_plugin()`”  
Section 20.9.3.7, “`mysql_connect()`”  
Section 20.9.3.13, “`mysql_eof()`”  
Section 20.9.3.15, “`mysql_error()`”

Section 20.9.10.3, “mysql\_load\_plugin()”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.3.71, “mysql\_use\_result()”  
Section 20.9.3, “C API Function Descriptions”  
Section 20.9.2, “C API Function Overview”  
Section 12.7.8.1.1, “Signal Condition Information Items”  
Section C.2, “Types of Error Values”  
Section 20.9.11.1, “Why mysql\_store\_result() Sometimes Returns NULL After mysql\_query() Returns Success”  
Section 21.2.4.7, “Writing Audit Plugins”

## mysql\_escape\_string()

Section 20.9.3.16, “mysql\_escape\_string()”  
Section 20.9.2, “C API Function Overview”

## mysql\_fetch\_field()

Section 20.9.3.17, “mysql\_fetch\_field()”  
Section 20.9.3.23, “mysql\_field\_seek()”  
Section 20.9.3.24, “mysql\_field\_tell()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”

## mysql\_fetch\_field\_direct()

Section 20.9.3.18, “mysql\_fetch\_field\_direct()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.2, “C API Function Overview”

## mysql\_fetch\_fields()

Section 20.9.3.19, “mysql\_fetch\_fields()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.2, “C API Function Overview”

## mysql\_fetch\_lengths()

Section 20.9.3.20, “mysql\_fetch\_lengths()”  
Section 20.9.3.21, “mysql\_fetch\_row()”  
Section 20.9.2, “C API Function Overview”

## mysql\_fetch\_row()

Section 20.9.3.13, “mysql\_eof()”  
Section 20.9.3.14, “mysql\_errno()”  
Section 20.9.3.20, “mysql\_fetch\_lengths()”  
Section 20.9.3.21, “mysql\_fetch\_row()”  
Section 20.9.3.59, “mysql\_row\_tell()”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.3.71, “mysql\_use\_result()”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”  
Section 13.11.1, “FEDERATED Storage Engine Overview”  
Section 20.9.11.2, “What Results You Can Get from a Query”

## mysql\_field\_count(&mysql)

Section 20.9.3.22, “mysql\_field\_count()”  
Section 20.9.3.47, “mysql\_num\_fields()”

## mysql\_field\_count()

Section 20.9.3.22, “mysql\_field\_count()”  
Section 20.9.3.47, “mysql\_num\_fields()”  
Section 20.9.3.51, “mysql\_query()”  
Section 20.9.3.54, “mysql\_real\_query()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”

Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.11.1, “Why mysql\_store\_result() Sometimes Returns NULL After mysql\_query() Returns Success”

## mysql\_field\_seek()

Section 20.9.3.17, “mysql\_fetch\_field()”  
Section 20.9.3.23, “mysql\_field\_seek()”  
Section 20.9.3.24, “mysql\_field\_tell()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”

## mysql\_field\_tell()

Section 20.9.3.24, “mysql\_field\_tell()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.2, “C API Function Overview”

## mysql\_free\_result()

Section C.5.2.14, “Commands out of sync”  
Section 20.9.3.25, “mysql\_free\_result()”  
Section 20.9.3.41, “mysql\_list\_dbs()”  
Section 20.9.3.42, “mysql\_list\_fields()”  
Section 20.9.3.43, “mysql\_list\_processes()”  
Section 20.9.3.44, “mysql\_list\_tables()”  
Section 20.9.3.46, “mysql\_next\_result()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.3.71, “mysql\_use\_result()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.6, “C API Prepared Statement Function Overview”

## mysql\_get\_character\_set\_info()

Section 20.9.3.26, “mysql\_get\_character\_set\_info()”  
Section 20.9.2, “C API Function Overview”  
Section 9.4.2, “Choosing a Collation ID”

## mysql\_get\_client\_info()

Section 20.9.3.7, “mysql\_connect()”  
Section 20.9.3.27, “mysql\_get\_client\_info()”  
Section 20.9.2, “C API Function Overview”

## mysql\_get\_client\_version()

Section 20.9.3.28, “mysql\_get\_client\_version()”  
Section 20.9.2, “C API Function Overview”

## mysql\_get\_host\_info()

Section 20.9.3.29, “mysql\_get\_host\_info()”  
Section 20.9.2, “C API Function Overview”

## mysql\_get\_proto\_info()

Section 20.9.3.30, “mysql\_get\_proto\_info()”  
Section 20.9.2, “C API Function Overview”

## mysql\_get\_server\_info()

Section 20.9.3.31, “mysql\_get\_server\_info()”  
Section 20.9.2, “C API Function Overview”

## mysql\_get\_server\_version()

Section 20.9.3.32, “mysql\_get\_server\_version()”  
Section 20.9.2, “C API Function Overview”

## mysql\_get\_ssl\_cipher()

Section 20.9.3.33, “mysql\_get\_ssl\_cipher()”  
Section 20.9.2, “C API Function Overview”  
Section 5.5.8.2, “Using SSL Connections”

## mysql\_hex\_string()

Section 20.9.3.34, “mysql\_hex\_string()”  
Section 20.9.2, “C API Function Overview”

## mysql\_info()

Section 12.1.6, “ALTER TABLE Syntax”  
Section 12.2.5.2, “INSERT DELAYED Syntax”  
Section 12.2.5, “INSERT Syntax”  
Section 12.2.6, “LOAD DATA INFILE Syntax”  
Section 1.8.6.1, “PRIMARY KEY and UNIQUE Index Constraints”  
Section 12.2.11, “UPDATE Syntax”  
Section 20.9.3.35, “mysql\_info()”  
Section 20.9.3.49, “mysql\_options()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.11.2, “What Results You Can Get from a Query”

## mysql\_init()

Section 20.9.8.1, “my\_init()”  
Section 20.9.3.5, “mysql\_close()”  
Section 20.9.3.33, “mysql\_get\_ssl\_cipher()”  
Section 20.9.3.36, “mysql\_init()”  
Section 20.9.3.40, “mysql\_library\_init()”  
Section 20.9.3.49, “mysql\_options()”  
Section 20.9.3.52, “mysql\_real\_connect()”  
Section 20.9.3.67, “mysql\_ssl\_set()”  
Section 20.9.8.3, “mysql\_thread\_init()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.17.2, “How to Write a Threaded Client”

## mysql\_insert\_id()

Section 12.1.14, “CREATE TABLE Syntax”  
Section 12.2.5, “INSERT Syntax”  
Section 20.9.3.37, “mysql\_insert\_id()”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.11.3, “How to Get the Unique ID for the Last Inserted Row”  
Section 11.14, “Information Functions”  
Section 5.1.3, “Server System Variables”  
Section 1.8.5.3, “Transaction and Atomic Operation Differences”  
Section 3.6.9, “Using AUTO\_INCREMENT”  
Section 20.9.11.2, “What Results You Can Get from a Query”

## mysql\_kill()

Section 20.9.3.38, “mysql\_kill()”  
Section 20.9.3.70, “mysql\_thread\_id()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.12, “Controlling Automatic Reconnection Behavior”

## mysql\_library\_end()

Section 20.9.3.39, “mysql\_library\_end()”  
Section 20.9.3.40, “mysql\_library\_init()”  
Section 20.9.2, “mysql\_server\_end()”

Section 20.9.9, “C API Embedded Server Function Descriptions”  
Section 20.9.2, “C API Function Overview”  
Section 20.8, “libmysqld, the Embedded MySQL Server Library”

## mysql\_library\_init()

Section 20.9.8.1, “my\_init()”  
Section 20.9.3.40, “mysql\_library\_init()”  
Section 20.9.10.3, “mysql\_load\_plugin()”  
Section 20.9.9.1, “mysql\_server\_init()”  
Section 20.9.8.3, “mysql\_thread\_init()”  
Section 20.9.9, “C API Embedded Server Function Descriptions”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.17.2, “How to Write a Threaded Client”  
Section 20.8.3, “Options with the Embedded Server”  
Section 20.8, “libmysqld, the Embedded MySQL Server Library”

## mysql\_library\_init(0, NULL, NULL)

Section 20.9.3.40, “mysql\_library\_init()”

## mysql\_list\_dbs()

Section 20.9.3.25, “mysql\_free\_result()”  
Section 20.9.3.41, “mysql\_list\_dbs()”  
Section 20.9.2, “C API Function Overview”

## mysql\_list\_fields()

Section 20.9.3.42, “mysql\_list\_fields()”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”

## mysql\_list\_processes()

Section 20.9.3.43, “mysql\_list\_processes()”  
Section 20.9.2, “C API Function Overview”

## mysql\_list\_tables()

Section 20.9.3.44, “mysql\_list\_tables()”  
Section 20.9.2, “C API Function Overview”

## mysql\_load\_plugin()

Section 20.9.10.3, “mysql\_load\_plugin()”  
Section 20.9.10.4, “mysql\_load\_plugin\_v()”  
Section 20.9.2, “C API Function Overview”  
Section 21.2.4.2.3, “Client Plugin Descriptors”

## mysql\_load\_plugin\_v()

Section 20.9.10.4, “mysql\_load\_plugin\_v()”  
Section 20.9.2, “C API Function Overview”

## mysql\_more\_results()

Section 20.9.3.45, “mysql\_more\_results()”  
Section 20.9.3.46, “mysql\_next\_result()”  
Section 20.9.7.17, “mysql\_stmt\_next\_result()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.13, “C API Support for Multiple Statement Execution”

## mysql\_next\_result()

Section 12.2.1, “CALL Syntax”  
Section 20.9.3.45, “mysql\_more\_results()”  
Section 20.9.3.46, “mysql\_next\_result()”

Section 20.9.3.52, “mysql\_real\_connect()”  
Section 20.9.3.64, “mysql\_set\_server\_option()”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.13, “C API Support for Multiple Statement Execution”

## **mysql\_num\_fields()**

Section 20.9.3.47, “mysql\_num\_fields()”  
Section 20.9.7.23, “mysql\_stmt\_result\_metadata()”  
Section 20.9.2, “C API Function Overview”

## **mysql\_num\_fields(result)**

Section 20.9.3.21, “mysql\_fetch\_row()”

## **mysql\_num\_fields(result)-1**

Section 20.9.3.18, “mysql\_fetch\_field\_direct()”

## **mysql\_num\_rows()**

Section 20.9.3.1, “mysql\_affected\_rows()”  
Section 20.9.3.48, “mysql\_num\_rows()”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.3.71, “mysql\_use\_result()”  
Section 20.9.1, “C API Data Structures”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.11.2, “What Results You Can Get from a Query”

## **mysql\_num\_rows(result)-1**

Section 20.9.3.9, “mysql\_data\_seek()”

## **mysql\_options()**

Section 20.9.3.49, “mysql\_options()”  
Section 20.9.3.50, “mysql\_ping()”  
Section 20.9.3.52, “mysql\_real\_connect()”  
Section 20.9.7.11, “mysql\_stmt\_fetch()”  
Section 20.9.10, “C API Client Plugin Functions”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.5, “C API Prepared Statement Data Structures”  
Section 21.2.4.2.3, “Client Plugin Descriptors”  
Section 9.1.4, “Connection Character Sets and Collations”  
Section 20.9.12, “Controlling Automatic Reconnection Behavior”  
Section 21.2.2, “Plugin API Components”  
Section 5.6.4, “Using Client Programs in a Multiple-Server Environment”  
Section 21.2.4.8.3, “Using the Authentication Plugins”

## **mysql\_options(...**

### **MYSQL\_OPT\_LOCAL\_INFILE, 0)**

Section 5.3.5, “Security Issues with LOAD DATA LOCAL”

## **mysql\_options(...,**

### **MYSQL\_OPT\_READ\_TIMEOUT,...)**

Section C.5.2.9, “MySQL server has gone away”

## **mysql\_options(...,**

### **MYSQL\_OPT\_WRITE\_TIMEOUT,...)**

Section C.5.2.9, “MySQL server has gone away”

## **mysql\_options(mysql, MYSQL\_SET\_CHARSET\_NAME, "charset\_name")**

Section 20.9.3.52, “mysql\_real\_connect()”

## **mysql\_ping()**

Section C.5.2.9, “MySQL server has gone away”  
Section 20.9.3.50, “mysql\_ping()”  
Section 20.9.3.70, “mysql\_thread\_id()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.12, “Controlling Automatic Reconnection Behavior”

## **mysql\_plugin\_options()**

Section 20.9.10.5, “mysql\_plugin\_options()”  
Section 20.9.2, “C API Function Overview”

## **mysql\_query()**

Section 12.2.1, “CALL Syntax”  
Section 20.9.3.1, “mysql\_affected\_rows()”  
Section 20.9.3.8, “mysql\_create\_db()”  
Section 20.9.3.11, “mysql\_drop\_db()”  
Section 20.9.3.17, “mysql\_fetch\_field()”  
Section 20.9.3.38, “mysql\_kill()”  
Section 20.9.3.46, “mysql\_next\_result()”  
Section 20.9.3.51, “mysql\_query()”  
Section 20.9.3.52, “mysql\_real\_connect()”  
Section 20.9.3.54, “mysql\_real\_query()”  
Section 20.9.3.56, “mysql\_reload()”  
Section 20.9.3.63, “mysql\_set\_local\_infile\_handler()”  
Section 20.9.3.64, “mysql\_set\_server\_option()”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.3.71, “mysql\_use\_result()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.13, “C API Support for Multiple Statement Execution”  
Section 20.9.11.3, “How to Get the Unique ID for the Last Inserted Row”  
Section 20.9.17.2, “How to Write a Threaded Client”  
Section 20.9.11.1, “Why mysql\_store\_result() Sometimes Returns NULL After mysql\_query() Returns Success”

## **mysql\_real\_connect()**

Section 12.2.1, “CALL Syntax”  
Section 20.9.3.1, “mysql\_affected\_rows()”  
Section 20.9.3.3, “mysql\_change\_user()”  
Section 20.9.3.7, “mysql\_connect()”  
Section 20.9.3.36, “mysql\_init()”  
Section 20.9.3.46, “mysql\_next\_result()”  
Section 20.9.3.49, “mysql\_options()”  
Section 20.9.3.52, “mysql\_real\_connect()”  
Section 20.9.3.64, “mysql\_set\_server\_option()”  
Section 20.9.3.66, “mysql\_sqlstate()”  
Section 20.9.3.67, “mysql\_ssl\_set()”  
Section 20.9.2, “C API Function Overview”  
Section 20.9.13, “C API Support for Multiple Statement Execution”  
Chapter 11, *Functions and Operators*  
Section 11.14, “Information Functions”

Section 15.3.7, “Setting Up Replication Using SSL”  
Section 15.1.1.8, “Setting Up Replication with Existing Data”  
Section 15.1.1.7, “Setting Up Replication with New Master and Slaves”  
Section 15.1.1.10, “Setting the Master Configuration on the Slave”  
Section 15.2.2.2, “Slave Status Logs”  
Section 15.3.6, “Switching Masters During Failover”  
Section 1.5, “What Is New in MySQL 5.5”

## CHECK TABLE

Section 12.1.6.1, “ALTER TABLE Partition Operations”  
Section 12.4.2.2, “CHECK TABLE Syntax”  
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 12.1.16, “CREATE VIEW Syntax”  
Section 13.3.14.3, “InnoDB General Troubleshooting”  
Section 6.6, “MyISAM Table Maintenance and Crash Recovery”  
Section C.5.2.9, “MySQL server has gone away”  
Section 20.9.3.69, “mysql\_store\_result()”  
Section 20.9.3.71, “mysql\_use\_result()”  
Section 13.3.7, “Backing Up and Recovering an InnoDB Database”  
Section 13.5.4.1, “Corrupted MyISAM Tables”  
Description  
Description  
Description  
Description  
Section 7.10.5, “External Locking”  
Section 6.6.3, “How to Repair MyISAM Tables”  
Section 1.7, “How to Report Bugs or Problems”  
Section 16.3.3, “Maintenance of Partitions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 13.5.4.2, “Problems from Tables Not Being Closed Properly”  
Section 16.5, “Restrictions and Limitations on Partitioning”  
Section E.3, “Restrictions on Server-Side Cursors”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section E.5, “Restrictions on Views”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 6.6.5, “Setting Up a MyISAM Table Maintenance Schedule”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.8, “The ARCHIVE Storage Engine”  
Section 13.10, “The MERGE Storage Engine”

## CHECK TABLE ... EXTENDED

Section 12.4.2.2, “CHECK TABLE Syntax”

## CHECK TABLE ... FOR UPGRADE

Section 12.4.2.5, “REPAIR TABLE Syntax”

## CHECKSUM TABLE

Section 12.4.2.3, “CHECKSUM TABLE Syntax”  
Section 12.1.14, “CREATE TABLE Syntax”

## CLOSE

Section 12.7.5.4, “Cursor CLOSE Statement”

## COMMIT

Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 13.3.13, “InnoDB Error Handling”  
Section 13.3.14.1, “InnoDB Performance Tuning Tips”  
Section 12.3.5, “LOCK TABLES and UNLOCK TABLES Syntax”  
Section 12.3.4, “SAVEPOINT and ROLLBACK TO SAVEPOINT Syntax”  
Section 12.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 7.5.4, “Bulk Data Loading for InnoDB Tables”  
Description  
Section 7.11.5.1, “How MySQL Uses Threads for Client Connections”  
Section 13.3.5.1, “Using InnoDB Transactions”  
Section 13.3.9.7, “Implicit Transaction Commit and Rollback”

Section 12.3, “MySQL Transactional and Locking Statements”  
Section 15.1.1.4, “Obtaining the Replication Master Binary Log Coordinates”  
Section 15.1.3.3, “Replication Slave Options and Variables”  
Section 15.4.1.29, “Replication and Transactions”  
Section 13.3.15, “Limits on InnoDB Tables”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.5, “Server Status Variables”  
Section 5.1.3, “Server System Variables”  
Section 7.2.2.1, “Speed of INSERT Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Chapter 13, *Storage Engines*  
Section 13.3.9, “The InnoDB Transaction Model and Locking”  
Section 5.2.4, “The Binary Log”  
Section 1.8.5.3, “Transaction and Atomic Operation Differences”  
Section 17.3.1, “Trigger Syntax”  
Section 1.5, “What Is New in MySQL 5.5”

## CREATE DATABASE

Section 12.1.8, “CREATE DATABASE Syntax”  
Section 12.4.5.8, “SHOW CREATE DATABASE Syntax”  
Section 9.1.9.3, “SHOW Statements and INFORMATION\_SCHEMA”  
Section 20.9.3.8, “mysql\_create\_db()”  
Section 6.1, “Backup and Recovery Types”  
Section 15.1.3.4, “Binary Log Options and Variables”  
Section 20.9.2, “C API Function Overview”  
Section 9.1.5, “Configuring the Character Set and Collation for Applications”  
Section 6.4.5.2, “Copy a Database from one Server to Another”  
Section 9.1.3.2, “Database Character Set and Collation”  
Description  
Description  
Section 6.4.1, “Dumping Data in SQL Format with mysqldump”  
Section 15.2.3.1, “Evaluation of Database-Level Replication and Binary Logging Options”  
Section 15.2.3, “How Servers Evaluate Replication Filtering Rules”  
Section 8.2.2, “Identifier Case Sensitivity”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 19.4, “Performance Schema Instrument Naming Conventions”  
Section 6.4.2, “Reloading SQL-Format Backups”  
Section 15.1.3.3, “Replication Slave Options and Variables”  
Section 9.1.3.1, “Server Character Set and Collation”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## CREATE DATABASE IF NOT EXISTS

Section 15.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

## CREATE DATABASE dbx

Section 15.2.3, “How Servers Evaluate Replication Filtering Rules”

## CREATE EVENT

Section 12.1.2, “ALTER EVENT Syntax”  
Section 12.1.9, “CREATE EVENT Syntax”  
Section 12.4.5.9, “SHOW CREATE EVENT Syntax”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 11.14, “Information Functions”  
Section 15.4.1.8, “Replication of Invoked Features”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 18.20, “The INFORMATION\_SCHEMA EVENTS Table”

## CREATE EVENT IF NOT EXISTS

Section 15.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

## CREATE FUNCTION

Section 12.1.3, “ALTER FUNCTION Syntax”  
Section 12.4.3.1, “CREATE FUNCTION Syntax for User-Defined Functions”  
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 12.4.3.2, “DROP FUNCTION Syntax”  
Section 21.3, “Adding New Functions to MySQL”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 21.3.2.5, “Compiling and Installing User-Defined Functions”  
Description  
Section 8.2.4, “Function Name Parsing and Resolution”  
Section 11.14, “Information Functions”  
Section 15.4.1.8, “Replication of Invoked Features”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 17.2.1, “Stored Routine Syntax”  
Section 12.1.10, “The CREATE FUNCTION Statement”  
Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”  
Section 21.3.2.6, “User-Defined Function Security Precautions”

## CREATE INDEX

Section 12.1.6, “ALTER TABLE Syntax”  
Section 12.1.11, “CREATE INDEX Syntax”  
Section 11.17.6.1, “Creating Spatial Indexes”  
Section 11.9, “Full-Text Search Functions”  
Section 7.7, “Optimizing for MEMORY Tables”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.3, “Server System Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## CREATE LOGFILE GROUP

Description  
Section 18.21, “The INFORMATION\_SCHEMA FILES Table”

## CREATE OR REPLACE VIEW

Section 12.1.7, “ALTER VIEW Syntax”  
Section 12.1.16, “CREATE VIEW Syntax”  
Section E.5, “Restrictions on Views”

## CREATE PROCEDURE

Section 12.1.4, “ALTER PROCEDURE Syntax”  
Section 12.2.1, “CALL Syntax”  
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 17.7, “Binary Logging of Stored Programs”  
Description  
Section 11.14, “Information Functions”  
Section 15.4.1.8, “Replication of Invoked Features”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 17.2.1, “Stored Routine Syntax”

## CREATE SCHEMA

Section 12.1.8, “CREATE DATABASE Syntax”

## CREATE SERVER

Section 12.1.5, “ALTER SERVER Syntax”  
Section 12.1.13, “CREATE SERVER Syntax”  
Section 13.11.3, “FEDERATED Storage Engine Notes and Tips”  
Section 12.4.6.3, “FLUSH Syntax”  
Section 13.11.2.2, “Creating a FEDERATED Table Using CREATE SERVER”  
Section 7.11.4.1, “How MySQL Uses Memory”  
Section 13.11.2, “How to Create FEDERATED Tables”

## CREATE TABLE

Section 4.5.1.1, “mysql Options”  
Section 12.1.6.2, “ALTER TABLE Examples”  
Section 12.1.6.1, “ALTER TABLE Partition Operations”  
Section 12.1.6, “ALTER TABLE Syntax”  
Section 13.3.5.3, “AUTO\_INCREMENT Handling in InnoDB”  
Section 12.1.9, “CREATE EVENT Syntax”  
Section 12.1.11, “CREATE INDEX Syntax”  
Section 12.1.13, “CREATE SERVER Syntax”  
Section 12.1.14.1, “CREATE TABLE ... SELECT Syntax”  
Section 12.1.14, “CREATE TABLE Syntax”  
Section 12.8.1, “DESCRIBE Syntax”  
Section 13.3.5.4, “FOREIGN KEY Constraints”  
Section 16.2.4, “HASH Partitioning”  
Section 12.8.3, “HELP Syntax”  
Section 13.3.14.3, “InnoDB General Troubleshooting”

Section 21.2.4.7, “Writing Audit Plugins”

## DELETE FROM ... WHERE ...

Section 13.3.9.6, “Locks Set by Different SQL Statements in InnoDB”

## DESCRIBE

Section 12.1.14, “`CREATE TABLE` Syntax”  
Section 12.8.1, “`DESCRIBE` Syntax”  
Section 12.8.2, “`EXPLAIN` Syntax”  
Section 7.2.1.3, “Optimizing `LIMIT` Queries”  
Section 12.4.5.6, “`SHOW COLUMNS` Syntax”  
Section 20.9.7.28, “`mysql_stmt_store_result()`”  
Section 20.9.3.69, “`mysql_store_result()`”  
Section 20.9.3.71, “`mysql_use_result()`”  
Section 20.9.1, “C API Data Structures”

Section 20.9.2, “C API Function Overview”  
Section 3.3.2, “Creating a Table”  
Section 7.11.3, “Optimizing Disk I/O”  
Section 18.31, “Extensions to `SHOW` Statements”  
Section 3.4, “Getting Information About Databases and Tables”  
Section 7.4.3.3, “How MySQL Uses Internal Temporary Tables”  
Section 7.8.1, “Optimizing Queries with `EXPLAIN`”  
Section 12.1.14.2, “Silent Column Specification Changes”  
Section 18.19, “The `INFORMATION_SCHEMA PARTITIONS` Table”  
Section 9.1.12, “UTF-8 for Metadata”  
Section 3.6.6, “Using Foreign Keys”

## DO

Section 12.1.2, “`ALTER EVENT` Syntax”  
Section 12.1.9, “`CREATE EVENT` Syntax”  
Section 12.2.3, “`DO` Syntax”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 20.9.4, “C API Prepared Statements”  
Section 5.2.4.4, “Logging Format for Changes to `mysql` Database Tables”  
Section 11.15, “Miscellaneous Functions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section E.4, “Restrictions on Subqueries”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 12.2.10, “Subquery Syntax”  
Section 18.20, “The `INFORMATION_SCHEMA EVENTS` Table”

## DROP DATABASE

Section 12.1.17, “`DROP DATABASE` Syntax”  
Section 20.9.3.11, “`mysql_drop_db()`”  
Section 15.1.3.4, “Binary Log Options and Variables”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 20.9.2, “C API Function Overview”  
Description  
Description  
Section 6.4.1, “Dumping Data in SQL Format with `mysqldump`”  
Section 15.2.3.1, “Evaluation of Database-Level Replication and Binary Logging Options”  
Section 15.2.3, “How Servers Evaluate Replication Filtering Rules”  
Section 7.9.3.1, “How the Query Cache Operates”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 6.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”  
Section 15.1.3.3, “Replication Slave Options and Variables”  
Section 5.1.3, “Server System Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section E.9.5, “Windows Platform Limitations”

## DROP DATABASE IF EXISTS

Section 15.4.1.5, “Replication of `DROP ... IF EXISTS` Statements”

## DROP EVENT

Section 12.1.18, “`DROP EVENT` Syntax”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 15.4.1.8, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## DROP FUNCTION

Section 12.1.3, “`ALTER FUNCTION` Syntax”  
Section 12.4.3.1, “`CREATE FUNCTION` Syntax for User-Defined Functions”

Section 12.1.19, “`DROP FUNCTION` Syntax”  
Section 12.4.3.2, “`DROP FUNCTION` Syntax”  
Section 12.1.21, “`DROP PROCEDURE` and `DROP FUNCTION` Syntax”  
Section 21.3, “Adding New Functions to MySQL”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 21.3.2.5, “Compiling and Installing User-Defined Functions”  
Section 8.2.4, “Function Name Parsing and Resolution”  
Section 15.4.1.8, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 17.2.1, “Stored Routine Syntax”  
Section 21.3.2.6, “User-Defined Function Security Precautions”

## DROP INDEX

Section 12.1.6, “`ALTER TABLE` Syntax”  
Section 12.1.20, “`DROP INDEX` Syntax”  
Section 11.17.6.1, “Creating Spatial Indexes”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## DROP PROCEDURE

Section 12.1.4, “`ALTER PROCEDURE` Syntax”  
Section 12.1.21, “`DROP PROCEDURE` and `DROP FUNCTION` Syntax”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 15.4.1.8, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 17.2.1, “Stored Routine Syntax”

## DROP SCHEMA

Section 12.1.17, “`DROP DATABASE` Syntax”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 5.1.3, “Server System Variables”

## DROP SERVER

Section 12.1.22, “`DROP SERVER` Syntax”  
Section 12.4.6.3, “`FLUSH` Syntax”  
Section 7.11.4.1, “How MySQL Uses Memory”

## DROP TABLE

Section 4.5.1.1, “`mysql` Options”  
Section 12.1.6, “`ALTER TABLE` Syntax”  
Section 12.1.15, “`CREATE TRIGGER` Syntax”  
Section 12.1.23, “`DROP TABLE` Syntax”  
Section 13.11.3, “`FEDERATED` Storage Engine Notes and Tips”  
Section 13.3.14.1, “`InnoDB` Performance Tuning Tips”  
Section 12.3.5, “`LOCK TABLES` and `UNLOCK TABLES` Syntax”  
Section 13.10.2, “`MERGE` Table Problems”  
Section 12.4.5.35, “`SHOW SLAVE STATUS` Syntax”  
Section 12.4.5.41, “`SHOW WARNINGS` Syntax”  
Section 12.7.8.1, “`SIGNAL` Syntax”  
Section 12.5.2.5, “`START SLAVE` Syntax”  
Section 12.1.27, “`TRUNCATE TABLE` Syntax”  
Section 12.4.3.4, “`UNINSTALL PLUGIN` Syntax”  
Section 13.3.9.2, “Consistent Nonlocking Reads”  
Description  
Section 21.2.3.2, “Full-Text Parser Plugins”  
Section 7.9.3.1, “How the Query Cache Operates”  
Section 11.14, “Information Functions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 7.5.6, “Optimizing `InnoDB` DDL Operations”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section E.5, “Restrictions on Views”

Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 5.1.3, “Server System Variables”  
Section 5.2.4.2, “Setting The Binary Log Format”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.6, “The `MEMORY` Storage Engine”  
Section 13.10, “The `MERGE` Storage Engine”  
Section 13.3.14.4, “Troubleshooting `InnoDB` Data Dictionary Operations”  
Section E.9.5, “Windows Platform Limitations”

## DROP TABLE IF EXISTS

Section 15.4.1.5, “Replication of `DROP ... IF EXISTS` Statements”

## DROP TABLE t1

Section 7.10.4, “Metadata Locking Within Transactions”

## DROP TRIGGER

Section 12.1.24, “`DROP TRIGGER` Syntax”  
Description  
Section 15.4.1.8, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 17.3.1, “Trigger Syntax”

## DROP USER

Section 12.4.1.2, “`DROP USER` Syntax”  
Section 12.4.6.3, “`FLUSH` Syntax”  
Section 12.4.1.3, “`GRANT` Syntax”  
Section 12.4.1.5, “`REVOKE` Syntax”  
Section 7.11.4.1, “How MySQL Uses Memory”  
Section 11.14, “Information Functions”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 5.5.3, “Removing User Accounts”  
Section 15.4.1.20, “Replication of the `mysql` System Database”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## DROP USER 'x'@'localhost'

Section 21.2.4.8.3, “Using the Authentication Plugins”

## DROP VIEW

Section 12.1.25, “`DROP VIEW` Syntax”  
Section E.5, “Restrictions on Views”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 12.3.5.3, “Table-Locking Restrictions and Conditions”  
Section 17.5.1, “View Syntax”

## DROP VIEW IF EXISTS

Section 15.4.1.5, “Replication of `DROP ... IF EXISTS` Statements”

## EXECUTE

Section 12.2.1, “`CALL` Syntax”  
Section 12.6.2, “`EXECUTE` Syntax”  
Section 12.6.1, “`PREPARE` Syntax”  
Section 20.9.16, “C API Support for Prepared `CALL` Statements”  
Section 7.9.3.1, “How the Query Cache Operates”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section E.5, “Restrictions on Views”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.5, “Server Status Variables”

## EXPLAIN

Section 12.1.6, “ALTER TABLE Syntax”  
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 7.13.11, “DISTINCT Optimization”  
Section 7.8.2, “EXPLAIN Output Format”  
Section 12.8.2, “EXPLAIN Syntax”  
Chapter 18, *INFORMATION\_SCHEMA Tables*

Section 6.3.1, “Establishing a Backup Policy”  
Section 5.2, “MySQL Server Logs”  
Section 15.4.1.10, “Replication and FLUSH”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 5.2.6, “Server Log Maintenance”  
Section 5.1.9, “Server Response to Signals”  
Section 5.2.2, “The Error Log”  
Section 5.2.3, “The General Query Log”  
Section 15.2.2.1, “The Slave Relay Log”

## FLUSH MASTER

Section 12.4.6.3, “FLUSH Syntax”  
Section 15.4.1.10, “Replication and FLUSH”

## FLUSH PRIVILEGES

Section C.5.2.4, “Client does not support authentication protocol”  
Section 12.4.6.3, “FLUSH Syntax”  
Section 20.9.3.55, “`mysql_refresh()`”  
Section 20.9.3.56, “`mysql_reload()`”  
Section 5.5.2, “Adding User Accounts”  
Section 5.5.5, “Assigning Account Passwords”  
Section 5.4.7, “Causes of Access-Denied Errors”  
Description  
Section 7.11.4.1, “How MySQL Uses Memory”  
Section 5.4.2, “Privilege System Grant Tables”  
Section 15.4.1.10, “Replication and FLUSH”  
Section 5.3.4, “Security-Related `mysqld` Options”  
Section 5.1.2, “Server Command Options”  
Section 5.1.9, “Server Response to Signals”  
Section 5.5.4, “Setting Account Resource Limits”  
Section 1.2, “Typographical and Syntax Conventions”  
Section 5.4.6, “When Privilege Changes Take Effect”

## FLUSH QUERY CACHE

Section 12.4.6.3, “FLUSH Syntax”  
Section 7.9.3.4, “Query Cache Status and Maintenance”

## FLUSH SLAVE

Section 12.4.6.3, “FLUSH Syntax”  
Section 15.4.1.10, “Replication and FLUSH”

## FLUSH TABLE

Section 12.4.6.3, “FLUSH Syntax”  
Section 7.6.3, “Bulk Data Loading for MyISAM Tables”  
Section 7.2.2.1, “Speed of `INSERT` Statements”

## FLUSH TABLES

Section 12.4.6.3, “FLUSH Syntax”  
Section 12.2.4, “HANDLER Syntax”  
Section 12.2.5.2, “`INSERT DELAYED` Syntax”  
Section 13.10.2, “MERGE Table Problems”  
Section 20.9.3.55, “`mysql_refresh()`”  
Section 12.6.4, “Automatic Prepared Statement Repreparation”  
Section 7.6.3, “Bulk Data Loading for MyISAM Tables”  
Section 6.2, “Database Backup Methods”  
Description  
Description  
Section 7.12.5.2, “General Thread States”  
Section 7.4.3.1, “How MySQL Opens and Closes Tables”  
Section 7.11.4.1, “How MySQL Uses Memory”  
Section 15.1.1.4, “Obtaining the Replication Master Binary Log Coordinates”  
Section 13.5.4.2, “Problems from Tables Not Being Closed Properly”  
Section 7.9.3.4, “Query Cache Status and Maintenance”  
Section 15.4.1.10, “Replication and FLUSH”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 5.1.3, “Server System Variables”  
Section 7.2.2.1, “Speed of `INSERT` Statements”  
Section E.9.5, “Windows Platform Limitations”

## FLUSH TABLES WITH READ LOCK

Section 12.4.6.3, “FLUSH Syntax”  
Section 12.3.5, “`LOCK TABLES` and `UNLOCK TABLES` Syntax”  
Section 12.3.1, “`START TRANSACTION`, `COMMIT`, and `ROLLBACK` Syntax”  
Section 15.1.1.5, “Creating a Data Snapshot Using `mysqldump`”  
Section 6.2, “Database Backup Methods”  
Description  
Section 6.3.1, “Establishing a Backup Policy”  
Section 7.12.5.2, “General Thread States”  
Section 12.3.5.1, “Interaction of Table Locking and Transactions”  
Section 15.1.1.4, “Obtaining the Replication Master Binary Log Coordinates”  
Section 15.4.1.10, “Replication and FLUSH”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 5.1.3, “Server System Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## FLUSH TABLES `tbl_list` WITH READ LOCK

Section 12.4.6.3, “FLUSH Syntax”  
Description

## FLUSH TABLES `tbl_name` WITH READ LOCK

Section 12.2.1, “`CALL` Syntax”  
Section 12.2.4, “HANDLER Syntax”

## FLUSH USER\_RESOURCES

Section 12.4.6.3, “FLUSH Syntax”  
Section 5.5.4, “Setting Account Resource Limits”

## GRANT

Section 7.10.1, “Internal Locking Methods”  
Section 13.3.9.6, “Locks Set by Different SQL Statements in `InnoDB`”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 13.5.4.2, “Problems from Tables Not Being Closed Properly”  
Section 13.3.15, “Limits on `InnoDB` Tables”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 5.1.3, “Server System Variables”  
Section 7.2.2.1, “Speed of `INSERT` Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 7.11.1, “System Factors and Startup Parameter Tuning”  
Section 7.10.2, “Table Locking Issues”  
Section 12.3.5.3, “Table-Locking Restrictions and Conditions”  
Section 13.9, “The `BLACKHOLE` Storage Engine”  
Section 1.8.5.3, “Transaction and Atomic Operation Differences”  
Section 1.5, “What Is New in MySQL 5.5”

## **LOCK TABLES ... IN EXCLUSIVE MODE**

Section 1.5, “What Is New in MySQL 5.5”

## **LOCK TABLES ... IN SHARE MODE**

Section 1.5, “What Is New in MySQL 5.5”

## **LOCK TABLES ... READ**

Section 12.4.6.3, “`FLUSH` Syntax”

## **LOOP**

Section 12.7.1, “`BEGIN ... END` Compound Statement Syntax”  
Section 12.7.6.5, “`ITERATE` Statement”  
Section 12.7.6.4, “`LEAVE` Statement”  
Section 12.7.6.3, “`LOOP` Statement”  
Section 12.7.6, “Flow Control Constructs”

## **OPEN**

Section 12.7.5.2, “Cursor `OPEN` Statement”

## **OPTIMIZE TABLE**

Section 4.6.3.1, “`myisamchk` General Options”  
Section 12.1.6.1, “`ALTER TABLE` Partition Operations”  
Section 12.2.2, “`DELETE` Syntax”  
Section 12.4.6.4, “`KILL` Syntax”  
Section 13.10.2, “`MERGE` Table Problems”  
Section 6.6, “`MyISAM` Table Maintenance and Crash Recovery”  
Section 6.6.4, “`MyISAM` Table Optimization”  
Section 12.4.2.4, “`OPTIMIZE TABLE` Syntax”  
Section 12.1.27, “`TRUNCATE TABLE` Syntax”  
Section 21.5.1, “Debugging a MySQL Server”  
Description  
Section 13.5.3.2, “Dynamic Table Characteristics”  
Section 11.9.6, “Fine-Tuning MySQL Full-Text Search”  
Section 7.12.5.2, “General Thread States”  
Section C.5.4.3, “How MySQL Handles a Full Disk”  
Section 16.3.3, “Maintenance of Partitions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 7.6.1, “Optimizing `MyISAM` Queries”  
Section 7.2.5, “Other Optimization Tips”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 15.4.1.10, “Replication and `FLUSH`”  
Section 16.5, “Restrictions and Limitations on Partitioning”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.2, “Server Command Options”  
Section 5.1.3, “Server System Variables”  
Section 6.6.5, “Setting Up a `MyISAM` Table Maintenance Schedule”  
Section 7.2.2.2, “Speed of `UPDATE` Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.5.3.1, “Static (Fixed-Length) Table Characteristics”  
Section 13.8, “The `ARCHIVE` Storage Engine”  
Section 5.1.10, “The Shutdown Process”  
Section 5.2.5, “The Slow Query Log”  
Section 7.11.3.1.2, “Using Symbolic Links for Tables on Unix”

## **PREPARE**

Section 12.2.1, “`CALL` Syntax”  
Section 12.6.3, “`DEALLOCATE PREPARE` Syntax”  
Section 12.6.2, “`EXECUTE` Syntax”  
Section 12.6.1, “`PREPARE` Syntax”  
Section 12.6.4, “Automatic Prepared Statement Repreparation”  
Section 20.9.16, “C API Support for Prepared `CALL` Statements”  
Section 7.9.3.1, “How the Query Cache Operates”  
Section 8.2.2, “Identifier Case Sensitivity”  
Section 7.10.4, “Metadata Locking Within Transactions”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section E.5, “Restrictions on Views”

Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.5, “Server Status Variables”

## **PURGE BINARY LOGS**

Section 12.4.1.3, “GRANT Syntax”  
Section 12.5.1.1, “PURGE BINARY LOGS Syntax”  
Section 12.5.1.2, “RESET MASTER Syntax”  
Description  
Section 6.3.1, “Establishing a Backup Policy”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 5.2.6, “Server Log Maintenance”  
Section 5.1.3, “Server System Variables”  
Section 5.2.4, “The Binary Log”

## **RELEASE SAVEPOINT**

Section 12.3.4, “SAVEPOINT and ROLLBACK TO SAVEPOINT Syntax”

## **RENAME TABLE**

Section 12.1.6, “ALTER TABLE Syntax”  
Section 12.2.2, “DELETE Syntax”  
Section 12.1.26, “RENAME TABLE Syntax”  
Description  
Section 7.12.5.2, “General Thread States”  
Section 13.3.8, “Moving an InnoDB Database to Another Machine”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.3.3, “Using Per-Table Tablespace”  
Section 7.11.3.1.2, “Using Symbolic Links for Tables on Unix”

## **RENAME USER**

Section 12.4.1.3, “GRANT Syntax”  
Section 12.4.1.4, “RENAME USER Syntax”  
Section 11.14, “Information Functions”  
Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 5.4.6, “When Privilege Changes Take Effect”

## **REPAIR TABLE**

Section 4.6.3.1, “myisamchk General Options”  
Section 12.1.6.1, “ALTER TABLE Partition Operations”  
Section 12.1.6, “ALTER TABLE Syntax”  
Section 12.4.6.4, “KILL Syntax”  
Section 12.2.6, “LOAD DATA INFILE Syntax”  
Section 13.10.2, “MERGE Table Problems”  
Section 13.5.1, “MyISAM Startup Options”  
Section 6.6, “MyISAM Table Maintenance and Crash Recovery”  
Section 12.4.2.5, “REPAIR TABLE Syntax”  
Section 13.5.4.1, “Corrupted MyISAM Tables”  
Section 6.2, “Database Backup Methods”  
Description  
Section 7.10.5, “External Locking”  
Section 11.9.6, “Fine-Tuning MySQL Full-Text Search”  
Section 7.12.5.2, “General Thread States”  
Section C.5.4.3, “How MySQL Handles a Full Disk”  
Section 6.6.3, “How to Repair MyISAM Tables”

Section 1.7, “How to Report Bugs or Problems”  
Section 16.3.3, “Maintenance of Partitions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 13.5.4.2, “Problems from Tables Not Being Closed Properly”  
Section C.5.7.1, “Problems with ALTER TABLE”  
Section 15.4.1.10, “Replication and FLUSH”  
Section 15.4.1.15, “Replication and REPAIR TABLE”  
Section 16.5, “Restrictions and Limitations on Partitioning”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.3, “Server System Variables”  
Section 6.6.5, “Setting Up a MyISAM Table Maintenance Schedule”  
Section 7.6.4, “Speed of REPAIR TABLE Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.8, “The ARCHIVE Storage Engine”  
Section 5.1.10, “The Shutdown Process”  
Section 7.11.3.1.2, “Using Symbolic Links for Tables on Unix”

## **REPEAT**

Section 12.7.1, “BEGIN ... END Compound Statement Syntax”  
Section 12.7.4.2, “DECLARE for Handlers”  
Section 12.7.6.5, “ITERATE Statement”  
Section 12.7.6.4, “LEAVE Statement”  
Section 12.7.6.6, “REPEAT Statement”  
Section 17.1, “Defining Stored Programs”  
Section 12.7.6, “Flow Control Constructs”

## **REPLACE**

Section 12.1.14.1, “CREATE TABLE ... SELECT Syntax”  
Section 12.1.15, “CREATE TRIGGER Syntax”  
Section 12.2.5.2, “INSERT DELAYED Syntax”  
Section 12.2.5, “INSERT Syntax”  
Section 12.2.6, “LOAD DATA INFILE Syntax”  
Section 12.2.7, “LOAD XML Syntax”  
Section 13.10.2, “MERGE Table Problems”  
Section C.5.2.9, “MySQL server has gone away”  
Section 12.2.8, “REPLACE Syntax”  
Section 12.2.11, “UPDATE Syntax”  
Section 20.9.3.1, “mysql\_affected\_rows()”  
Section 20.9.4, “C API Prepared Statements”  
Section 13.3.5.3.2, “Configurable InnoDB Auto-Increment Locking”  
Section 10.1.4, “Data Type Default Values”  
Description  
Section 7.1, “Balancing Portability and Performance”  
Section 11.14, “Information Functions”  
Section 13.3.9.6, “Locks Set by Different SQL Statements in InnoDB”  
Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 16.1, “Overview of Partitioning in MySQL”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.2, “Server Command Options”  
Section 12.2.10, “Subquery Syntax”  
Section 13.8, “The ARCHIVE Storage Engine”  
Section 1.5, “What Is New in MySQL 5.5”

## **REPLACE ... SELECT**

Section 13.3.5.3.2, “Configurable InnoDB Auto-Increment Locking”

## **RESET**

Section 12.4.6.3, “FLUSH Syntax”  
Section 12.4.6.6, “RESET Syntax”  
Section 1.8.4, “MySQL Extensions to Standard SQL”

Section 12.3.3, “Statements That Cause an Implicit Commit”

## RESET MASTER

Section 12.4.6.3, “FLUSH Syntax”  
Section 12.5.1.2, “RESET MASTER Syntax”  
Section 12.4.5.35, “SHOW SLAVE STATUS Syntax”  
Section 20.9.3.55, “mysql\_refresh()”  
Section 15.3.6, “Switching Masters During Failover”  
Section 5.2.4, “The Binary Log”  
Section 1.5, “What Is New in MySQL 5.5”

## RESET QUERY CACHE

Section 7.12.5.4, “Query Cache Thread States”

## RESET SLAVE

Section 12.5.2.1, “CHANGE MASTER TO Syntax”  
Section 12.4.6.3, “FLUSH Syntax”  
Section 12.5.1.2, “RESET MASTER Syntax”  
Section 12.5.2.3, “RESET SLAVE Syntax”  
Section 12.4.5.35, “SHOW SLAVE STATUS Syntax”  
Section 20.9.3.55, “mysql\_refresh()”  
Section 15.1.3.3, “Replication Slave Options and Variables”  
Section 15.1.3, “Replication and Binary Logging Options and Variables”  
Section 1.5, “What Is New in MySQL 5.5”

## RESIGNAL

Section 12.7.2, “DECLARE Syntax”  
Section 12.7.8.2.1, “RESIGNAL Alone”  
Section 12.7.8.2.4, “RESIGNAL Requires an Active Handler”  
Section 12.7.8.2, “RESIGNAL Syntax”  
Section 12.7.8.2.2, “RESIGNAL with New Signal Information”  
Section 12.7.8.2.3, “RESIGNAL with a Condition Value and Optional New Signal Information”  
Section 12.7.8, “SIGNAL and RESIGNAL”  
Section E.2, “Restrictions on Signals”  
Section 1.5, “What Is New in MySQL 5.5”

## RESTORE

Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 5.3.4, “Security-Related mysql\_d Options”  
Section 5.1.2, “Server Command Options”  
Section 5.1.3, “Server System Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 1.5, “What Is New in MySQL 5.5”

## RESTORE TABLE

Section 7.11.3.1.2, “Using Symbolic Links for Tables on Unix”  
Section 1.5, “What Is New in MySQL 5.5”

## RETURN

Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 12.7.7, “RETURN Syntax”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”

## REVOKE

Section 12.4.1.2, “DROP USER Syntax”  
Section 12.4.6.3, “FLUSH Syntax”  
Section 12.4.1.3, “GRANT Syntax”  
Section 12.4.1.5, “REVOKE Syntax”  
Section 5.4.5, “Access Control, Stage 2: Request Verification”

Section 15.1.2.1, “Comparison of Statement-Based and Row-Based Replication”

Section 5.3.1, “General Security Guidelines”  
Section 7.11.4.1, “How MySQL Uses Memory”  
Section 11.14, “Information Functions”  
Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”  
Section 1.8.5, “MySQL Differences from Standard SQL”  
Section 5.4.2, “Privilege System Grant Tables”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 5.5.7, “Proxy Users”  
Section 15.4.4, “Replication FAQ”  
Section 15.4.1.20, “Replication of the mysql System Database”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 5.4, “The MySQL Access Privilege System”  
Section 5.5.1, “User Names and Passwords”  
Section 5.4.6, “When Privilege Changes Take Effect”

## REVOKE ALL PRIVILEGES

Section 12.4.1.3, “GRANT Syntax”  
Section 5.4.1, “Privileges Provided by MySQL”

## ROLLBACK

Section 13.3.13, “InnoDB Error Handling”  
Section 12.3.5, “LOCK TABLES and UNLOCK TABLES Syntax”  
Section 12.3.4, “SAVEPOINT and ROLLBACK TO SAVEPOINT Syntax”  
Section 12.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”  
Section 20.9.3.3, “mysql\_change\_user()”  
Section 17.7, “Binary Logging of Stored Programs”  
Section 13.3.9.8, “Deadlock Detection and Rollback”  
Section 13.3.5.1, “Using InnoDB Transactions”

Section 15.4.5, “Troubleshooting Replication”

## SHOW OPEN TABLES

Section 12.4.5.25, “SHOW OPEN TABLES Syntax”

## SHOW PLUGINS

Section 12.4.3.3, “INSTALL PLUGIN Syntax”  
Section 12.4.5.26, “SHOW PLUGINS Syntax”  
Section 5.1.7.1, “Installing and Uninstalling Plugins”  
Section 5.1.7.2, “Obtaining Server Plugin Information”  
Chapter 16, *Partitioning*  
Section 5.5.6, “Pluggable Authentication”  
Section 21.2.1, “Plugin API Characteristics”  
Section 21.2.2, “Plugin API Components”  
Section 15.3.8.2, “Semisynchronous Replication Installation and Configuration”  
Section 21.2.4.2.1, “Server Plugin Library and Plugin Descriptors”  
Section 18.17, “The INFORMATION\_SCHEMA PLUGINS Table”  
Section 1.5, “What Is New in MySQL 5.5”  
Section 21.2.4.7, “Writing Audit Plugins”  
Section 21.2.4.5, “Writing Daemon Plugins”  
Section 21.2.4.4, “Writing Full-Text Parser Plugins”  
Section 21.2.4.8.1, “Writing the Server-Side Authentication Plugin”

## SHOW PRIVILEGES

Section 12.4.5.27, “SHOW PRIVILEGES Syntax”

## SHOW PROCEDURE CODE

Section 12.4.5.20, “SHOW FUNCTION CODE Syntax”  
Section 12.4.5.28, “SHOW PROCEDURE CODE Syntax”

## SHOW PROCEDURE STATUS

Section 12.4.5.21, “SHOW FUNCTION STATUS Syntax”  
Section 12.4.5.29, “SHOW PROCEDURE STATUS Syntax”  
Section 17.2.3, “Stored Routine Metadata”

## SHOW PROCESSLIST

Section 12.4.1.3, “GRANT Syntax”  
Section 13.3.13, “InnoDB Error Handling”  
Section 12.4.6.4, “KILL Syntax”  
Section 12.4.5.30, “SHOW PROCESSLIST Syntax”  
Section 12.4.5.32, “SHOW PROFILES Syntax”  
Section 12.4.5.35, “SHOW SLAVE STATUS Syntax”  
Section 12.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”  
Section C.5.2.7, “Too many connections”  
Section 20.9.3.43, “mysql\_list\_processes()”  
Section 15.1.4.1, “Checking Replication Status”  
Description  
Section 7.12.5, “Examining Thread Information”  
Section 7.12.5.2, “General Thread States”  
Section 5.3.3, “Making MySQL Secure Against Attackers”  
Section 19.4, “Performance Schema Instrument Naming Conventions”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 15.4.4, “Replication FAQ”  
Section 15.2.1, “Replication Implementation Details”  
Section 15.3.6, “Switching Masters During Failover”  
Section 18.23, “The INFORMATION\_SCHEMA PROCESSLIST Table”  
Section 19.7.5.2, “The threads Table”  
Section 15.4.5, “Troubleshooting Replication”

## SHOW PROFILE

Section 12.4.5.31, “SHOW PROFILE Syntax”  
Section 12.4.5.32, “SHOW PROFILES Syntax”  
Section 7.12.5, “Examining Thread Information”  
Section 7.12.5.2, “General Thread States”  
Section 2.9.4, “MySQL Source-Configuration Options”  
Section 5.1.3, “Server System Variables”  
Section 18.28, “The INFORMATION\_SCHEMA PROFILING Table”

## SHOW PROFILES

Section 12.4.5.31, “SHOW PROFILE Syntax”  
Section 12.4.5.32, “SHOW PROFILES Syntax”  
Section 2.9.4, “MySQL Source-Configuration Options”  
Section 5.1.3, “Server System Variables”  
Section 18.28, “The INFORMATION\_SCHEMA PROFILING Table”

## SHOW RELAYLOG EVENTS

Section 12.4.5.3, “SHOW BINLOG EVENTS Syntax”  
Section 12.4.5.33, “SHOW RELAYLOG EVENTS Syntax”

## SHOW SCHEMAS

Section 12.4.5.15, “SHOW DATABASES Syntax”

## SHOW SESSION STATUS

Section 18.25, “The INFORMATION\_SCHEMA GLOBAL\_STATUS and SESSION\_STATUS Tables”

## SHOW SESSION VARIABLES

Section 18.26, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

## SHOW SLAVE HOSTS

Section 12.4.5.34, “SHOW SLAVE HOSTS Syntax”  
Section 15.1.4.1, “Checking Replication Status”  
Section 15.1.3.3, “Replication Slave Options and Variables”

Section 15.1.3, “Replication and Binary Logging Options and Variables”  
Section 12.5.1, “SQL Statements for Controlling Master Servers”

## SHOW SLAVE STATUS

Section 12.5.2.1, “CHANGE MASTER TO Syntax”  
Section 12.5.1.1, “PURGE BINARY LOGS Syntax”  
Section 12.4.5.35, “SHOW SLAVE STATUS Syntax”  
Section 12.5.2.5, “START SLAVE Syntax”  
Section 15.1.4.1, “Checking Replication Status”  
Description  
Section 15.4.6, “How to Report Replication Bugs or Problems”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 15.4.4, “Replication FAQ”  
Section 15.2.1, “Replication Implementation Details”  
Section 7.12.5.6, “Replication Slave I/O Thread States”  
Section 15.1.3.3, “Replication Slave Options and Variables”  
Section 15.4.1.17, “Replication and max\_allowed\_packet”  
Section 15.1.3, “Replication and Binary Logging Options and Variables”  
Section 12.5.2, “SQL Statements for Controlling Slave Servers”  
Section 5.1.5, “Server Status Variables”  
Section 15.3.7, “Setting Up Replication Using SSL”  
Section 15.4.1.24, “Slave Errors During Replication”  
Section 15.2.2.2, “Slave Status Logs”  
Section C.1, “Sources of Error Information”  
Section 15.4.5, “Troubleshooting Replication”

## SHOW STATUS

Section 12.2.5.2, “INSERT DELAYED Syntax”  
Section 12.4.5.36, “SHOW STATUS Syntax”  
Section 21.2.1, “Plugin API Characteristics”  
Section 7.9.3.4, “Query Cache Status and Maintenance”  
Section 15.2.1, “Replication Implementation Details”  
Section 15.4.1.26, “Replication Retries and Timeouts”  
Section 15.4.1.19, “Replication and Temporary Tables”  
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 15.3.8.3, “Semisynchronous Replication Monitoring”  
Section 21.2.4.2.1, “Server Plugin Library and Plugin Descriptors”  
Section 21.2.4.2.2, “Server Plugin Status and System Variables”  
Section 5.1.5, “Server Status Variables”  
Section 5.1.3, “Server System Variables”  
Section 21.2.4.7, “Writing Audit Plugins”  
Section 21.2.4.4, “Writing Full-Text Parser Plugins”  
Section 21.2.4, “Writing Plugins”

## SHOW STATUS LIKE 'perf%'

Section 19.5, “Performance Schema Status Monitoring”

## SHOW TABLE STATUS

Section 13.3.5.3, “AUTO\_INCREMENT Handling in InnoDB”  
Section 12.1.14, “CREATE TABLE Syntax”  
Section 12.8.1, “DESCRIBE Syntax”  
Section 13.3.4, “InnoDB Startup Options and System Variables”  
Section 12.4.5.6, “SHOW COLUMNS Syntax”  
Section 12.4.5.37, “SHOW TABLE STATUS Syntax”

Section 5.1.3, “Server System Variables”

## **time\_zone**

Section 12.1.9, “`CREATE EVENT` Syntax”  
Section 10.3.1.1, “`TIMESTAMP` Properties”  
Section 11.7, “Date and Time Functions”  
Section 5.2.4.3, “Mixed Binary Logging Format”  
Section 9.6, “MySQL Server Time Zone Support”  
Section 15.4.1.33, “Replication and Variables”  
Section 5.1.2, “Server Command Options”  
Section 5.1.3, “Server System Variables”

## **timed\_mutexes**

Section 12.4.5.16, “`SHOW ENGINE` Syntax”  
Section 5.1.3, “Server System Variables”

## **timestamp**

Section 13.11.3, “`FEDERATED` Storage Engine Notes and Tips”  
Section 5.2.4.3, “Mixed Binary Logging Format”  
Section 15.4.1.33, “Replication and Variables”

**timestamp = {timestamp\_value |**

**DEFAULT}**

Section 5.1.3, “Server System Variables”

**tmp\_table\_size**

Section 7.4.3.3, “How MySQL Uses Internal Temporary Tables”

Section 5.1.5, “Server Status Variables”

Section 5.1.3, “Server System Variables”

**tmpdir**

Section C.5.2.13, “Can't create/write to file”

Section 7.13.9, “ORDER BY Optimization”

Section 15.3.1.2, “Backing Up Raw Data from a Slave”

Section 6.2, “Database Backup Methods”

Section 15.1.3.3, “Replication Slave Options and Variables”

Section 5.1.3, “Server System Variables”

**transaction\_alloc\_block\_size**

Section 5.1.3, “Server System Variables”

**transaction\_allow\_batching**

Section 5.1.3, “Server System Variables”

**transaction\_prealloc\_size**

Section 5.1.3, “Server System Variables”

**tx\_isolation**

Section 12.3.6, “SET TRANSACTION Syntax”

Section 5.1.2, “Server Command Options”

Section 5.1.3, “Server System Variables”

**unique\_checks**

Section 13.3.5.2, “Converting Tables from Other Storage Engines to InnoDB”

Section 5.2.4.3, “Mixed Binary Logging Format”

Section 15.4.1.33, “Replication and Variables”

Section 5.1.3, “Server System Variables”

Section 5.2.4, “The Binary Log”

**updatable\_views\_with\_limit**

Section 5.1.3, “Server System Variables”

Section 17.5.3, “Updatable and Insertable Views”

**version**

Section 11.14, “Information Functions”

Section 5.1.3, “Server System Variables”

**version\_bdb**

Section 5.1.3, “Server System Variables”

**version\_comment**

Section 5.1.3, “Server System Variables”

**version\_compile\_machine**

Section 5.1.3, “Server System Variables”

**version\_compile\_os**

Section 5.1.3, “Server System Variables”

**wait\_timeout**

Section C.5.2.9, “MySQL server has gone away”

Section 20.9.3.52, “mysql\_real\_connect( )”

Section C.5.2.11, “Communication Errors and Aborted Connections”

Section 5.1.3, “Server System Variables”

**warning\_count**

Section 12.4.5.41, “SHOW WARNINGS Syntax”

Section 12.7.8.1.2, “Effect of Signals on Handlers, Cursors, and Statements”

Section 5.1.3, “Server System Variables”

Section C.1, “Sources of Error Information”
